

Enjoy these 4 seconds of AI animations from this cool still image by Meta!

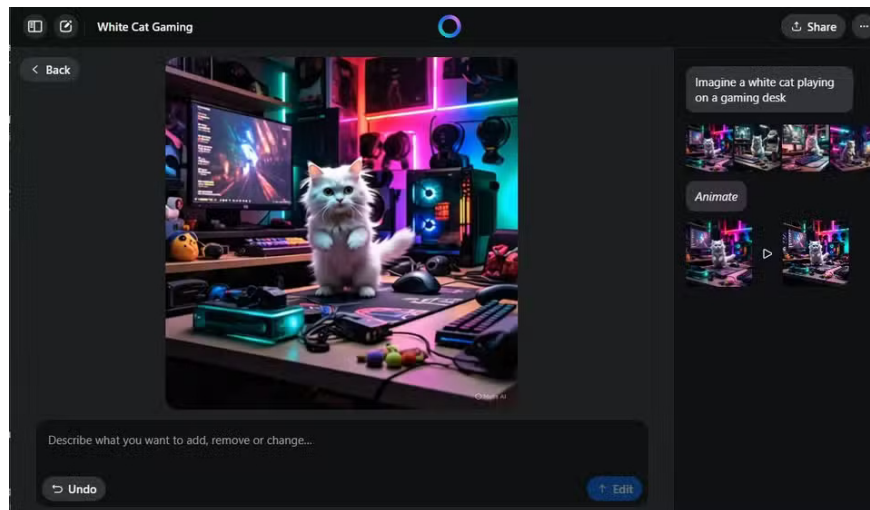

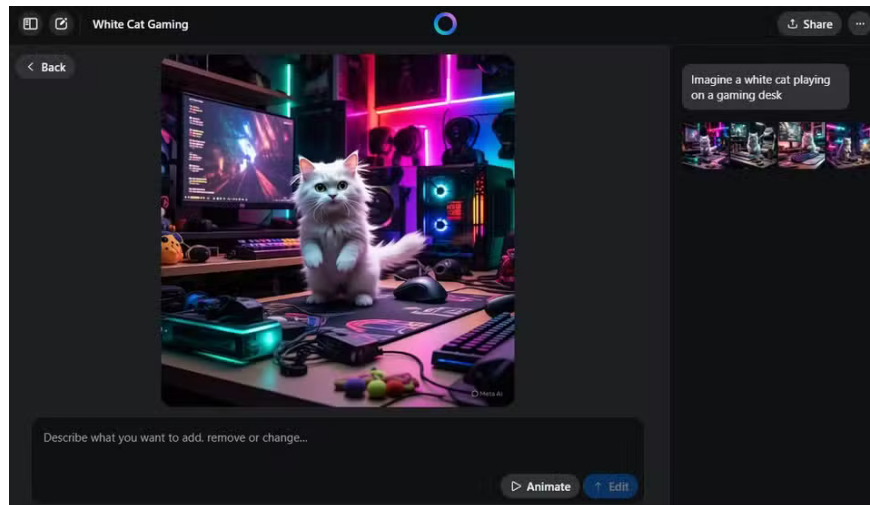

Upload a photo and watch Meta AI turn it into a vibrant, moving scene in seconds! The animation is only 4 seconds long, but there's something about these micro-animations that you can't miss.

Upload a photo and watch Meta AI turn it into a vibrant, moving scene in seconds! The animation is only 4 seconds long, but there's something about these micro-animations that you can't miss.

What are these animations? How to use them?

Meta AI leverages its Emu engine to turn any image into a four-second clip. Instead of dramatic gestures, it focuses on subtle movements. The result feels more like a fleeting moment than a regular video—almost as if the subject comes to life for a split second, then freezes again.

Using the tool is incredibly simple. Upload your image, hit **Animate**, and within seconds your snap will start moving. The AI analyzes the photo, identifies the subject and background, and then applies realistic motion. No manual adjustments required, just sit back and watch your render come to life.

Note : While Meta's animation tool is limited to 4-second animations, there are other AI video generators that can create entire videos from text prompts. Meta AI focuses on bringing life to static images.

Where stillness begins to move

The first experiment was an AI-generated image of two children walking on the beach. Nothing fancy, just a sunny day and an open sea. The children walked hand in hand, their arms swinging in rhythm. The animation captured a simple, playful, and deeply human rhythm.

Note : For each of the following side-by-side images, the image on the left is a still image and the image on the right is an AI-generated GIF derived from that image. The original MP4 animation was generated by Meta AI and has been converted to a GIF for easier viewing.
