What is a heater, fan heater?

Heaters, fan heaters are designed to resemble conventional fans, and some have circular cylindrical designs. This is a device that uses heating technology with mayso, halogen or carbon bulbs. When the fan is operating, electricity will be quickly converted into heat energy to help warm the room so you do not feel cold anymore.

Advantages of fan heating, lamp heating

Here are some advantages to explain that the models of heaters and fans used by many users choose to use:

1. The device has a compact design, simple structure, and most have a handle in the back to make it easier to move.
2. The price of the product is also much cheaper than other heating devices such as: 2-way air conditioner, oil heater .
3. The heater is also equipped with safety mechanisms such as self-disconnecting when tilting
4. When there is a light bulb problem, you can easily replace it at a low cost
5. Warming area of the product is also quite large, there are many levels of power for you to choose to best suit your needs.
6. Does not cause unpleasant noise when used.
7. Some ceramic heater fans will have an additional remote control for easy use.
8. Modern heating technology, quite safe, does not burn oxygen and heat quickly.

What kind of heater, fan should choose?

Currently there are fan heaters that use halogen bulbs, infrared heaters and ceramic heaters. To choose the right type of fan, learn the pros and cons of each one first!

1. Halogen fan, infrared heating fan

Advantages:

1. Compact, easy to use capable of fast heating after a few minutes of operation.
2. Affordable price, consistent with the economic conditions of the majority of consumers
3. Some products have the function of automatic disconnection when falling down, timer off very convenient and safe to use.

Defect:

1. Power from 300 - 1200 W, suitable for small areas from 5 - 25 m².

2. When in operation, halogen heating fan emits strong light which can cause dazzle, not really comfortable for users when using at night.
3. Long-term use of a fan can cause dry skin because halogen lamps burn oxygen in the air.
4. The face emits quite hot, avoiding special contact with young children, can hurt sensitive skin.

2. Ceramic heating fan

Ceramic heat fans or ceramic heat fans use ceramic discs to heat and heat the metal wire, thereby spreading heat to the environment.

Advantages:

1. Fan does not cause glare, does not dry the skin, good for families with the elderly and young children.
2. Ceramic heating fans have a timer off, safe with automatic shutdown when overheating or when falling.
3. Ceramic heating fan has a large capacity, fast heating, wider heating area than halogen fans thanks to heat convection, large temperature adjustment range (about 10 - 49 degrees C).
4. Ceramic heating fans stand out in aesthetics, very neat and luxurious in all spaces

Defect:

1. Like other heating fans, the front protects the fan very hot, which can cause unsafe if the user touches.
2. The price is higher than halogen fan, infrared fan

Notes to use heaters, fan heaters safely, most effectively

1. Do not close the room door when using: When the fan is operating, you should absolutely not close the room door because this will prevent the air from circulating, often leading to stifling phenomenon, lack of oxygen. Always leave your room door, windows ajar, or turn on the exhaust fan to allow air to circulate more easily.
2. To increase the humidity for the air, especially some fan models without built-in humidifying feature, you can use a basin of water placed in the room. This will help limit the possibility of causing dry skin, dry nose, dry eyes, helping to balance the humidity for the room.
3. Some high-end fan models will have an automatic shut-off feature when overheated. However, with conventional models, you should not use the fan continuously, should only be used for 2-3 hours then rest the fan for about 30 minutes to avoid overload, reduce the risk of fire and increase durability for product
4. When using, you absolutely should not put the fan too close to people, because the amount of heat emitted is sometimes not guaranteed to be safe for you. A safe distance is to keep the fan or the bed from 1.5 to 2 meters away.
5. Fan temperature should not be too high, too different from the outside temperature. By doing so you will be very susceptible to heat stroke, increasing the risk of cold infection. Experts recommend, the most suitable heat level should be in the range of 22 to 25 degrees C. This is both to ensure health and save significant amount of power.

Suggestions where to buy quality, guaranteed fan heaters

Currently on the market, you can easily find fan heater products at any supermarket, electronics store. However, there is no guarantee that you will own quality products. Finding a reliable purchase address is absolutely necessary.

META.vn is an address to supply and distribute genuine heaters and fans, which we would like to recommend to you.

At META, you will be able to consult and choose among many models of heaters with different technologies, different brands. All products are genuine, full papers.
