

Programmers were able to put the Like button on their own applications

Building on a feature that has been released for iOS earlier this year, Facebook is now allowing Android platform developers to place a Like button on their (direct) apps that link directly to a Facebook page.

Building on a feature that has been released for iOS earlier this year, Facebook is now allowing Android platform developers to place a Like button on their (direct) apps that link directly to a Facebook page.

The **Like** button in these private apps works just like the web and Facebook apps, allowing users to choose Like a specific application or page to see more information on Facebook's feed page. they.

Developers are happy to place Like buttons anywhere they like on their apps, but Facebook offers to recommend the Like button in some positions, for example after completing a good game. in the application settings section. Facebook also reminds developers to regularly return to their Facebook Page to interact with users who have visited the site via the Like button on the application.
