

## Qualcomm released three new Snapdragon processors for mid-range phones

Qualcomm has just introduced three new processors designed for phones and tablets: Snapdragon 429, 439 and 632.

Qualcomm has just introduced three new processors designed for phones and tablets: Snapdragon 429, 439 and 632. Despite being the latest processors in Qualcomm's 400 and 600 series, none of these products have Get the best features of the chip line. They actually lie at the average of each line, slightly better than the current basic choices.

Snapdragon 429 and 439 are expected to be 25% faster and save more power than chips 425 and 430. The 429 chip supports both a single 16 megapixel camera and a dual 8 megapixel camera and a 720p resolution screen. Meanwhile the 439 chip supports around 1080p resolution and the camera supports up to 21 megapixels or 8 megapixels.

The Snapdragon 632 can be up to 40% faster than the Snapdragon 626, supporting a 1080p screen, a 24 megapixel camera or a 13 megapixel dual camera, recording 4K video and a faster LTE network.

It is not surprising that these chips are just a combination of some of the chips available, but will be more attractive to phone makers because of software compatibility (even previous chip models). . The 400 chip line also helps manufacturing companies do not do much when switching between new processors.

New chip phones may appear in the second half of this year.

*Medium-level chips offer many choices for manufacturers*

In the US, the 400 and 600 chips are often used on many mid-range and low-end phones. Although the US, focusing on high-end chips like Snapdargon 800 (which can be found on many high-end phones like Samsung's Galaxy), Qualcomm said that the 600 series is in the high segment in many other countries, in when the 800 line is too expensive.

More options for this chip means that phone makers will have more and more options to offer phones with different features and prices.
