

## Quick charging tips twice for iPhone 6, iPhone 7

Normally, in 5 minutes you can only charge iPhone 3% more but in this way the number can be up to 6%.

When your iPhone is about to run out of battery and you need to move quickly, not near the power source. So you have to do how to get the iPhone to load the battery quickly and not harm your phone.

So refer to the article below to know how to charge the best battery for your phone using the iPad's 12-watt clean kit, which will make your iPhone shorten half of your phone's charging time.

iPhone 6 and 7 are the largest sized smartphones ever by Apple. It has a large screen from 4.7 inches to 5.5 inches, so these 2 models also have larger capacity batteries than the previous iPhones. Specifically, iPhone 6 has an 1810 mAh battery and iPhone 7 Plus has 2910 mAh battery capacity. However, the iPhone is not equipped with fast charging technology like some Android phones on the market, but a "tip" can make your iPhone charge a little faster. The less resource dispersion of other tasks will help iPhone "focus" on the battery charging task.

This is why many people believe that switching phones to Airplane Mode will help the device charge faster because it cuts off the ability to connect to the Internet and access phone information.

If you still want to receive messages and calls while charging, there are a number of other settings that you can influence to minimize the impact on iPhone charging. Turning off Wi-Fi connectivity, turning off Bluetooth connectivity, reducing screen brightness and disabling app notifications can be the first solution you should think

about. Apple also said that removing the iPhone protective cover could also help the device save battery power, especially when the phone appears to be too hot.

Also, if you have an iPad charger there, try using it to charge your iPhone, you'll see that the battery charging speed is significantly increased because the iPad charger provides faster power than iPhone charging.

Besides that basic charging tip, recently, the *Macotakara* site tested a new charging method, making it possible for users to fully charge the iPhone 6 in half the time. Accordingly, *Macotakara* used the iPad's 12 Watt charger to charge iPhone 6 and iPhone 7 Plus. The results showed that Apple's new-generation iPhone duo quickly filled the battery, shortening 1/2 time compared to using the iPhone's usual 5 Watt charger.

The charging mechanism is quite complicated, but users can imagine pumping water into a ball. If you try to pump quickly with a big nozzle, the mouth burns small, only a certain amount of water will pass, the rest will fall out. Since then, the iPhone's battery has been unable to handle the 12-watt charger's charging capacity, but the iPhone 6 and iPhone 6 Plus can do it.

However, if using a high-capacity charger will make the phone faster than the battery, so users should consider before applying this quick charging tips for iPhone 6 and 6 Plus.
