

Raspberry Pi computer with 5 megapixel camera

On Monday, the Raspberry Pi Foundation released a cheaper version of the Model A model of the popular Raspberry Pi computer.

On Monday, the Raspberry Pi Foundation released a cheaper version of the Model A model of the popular Raspberry Pi computer.

And just two days later, the organization went on to unveil a new 5 megapixel camera app for the 'tiny,' device that promises to add to the appeal of this low-cost device.

According to information from the Raspberry Pi Foundation, the new camera unit can connect directly to the Raspberry Pi and record videos with 1080p HD quality.

Of course, the cost of the camera is not cheap, compared to the Raspberry Pi computer itself.

To be able to own this supplement, users will lose \$ 25, which is exactly the price of the newly launched Raspberry Pi Model A model. It takes at least another month, the new Raspberry Pi Foundation can release the above integrated camera unit.
