

Remove viruses, trojans on Windows 7 manually

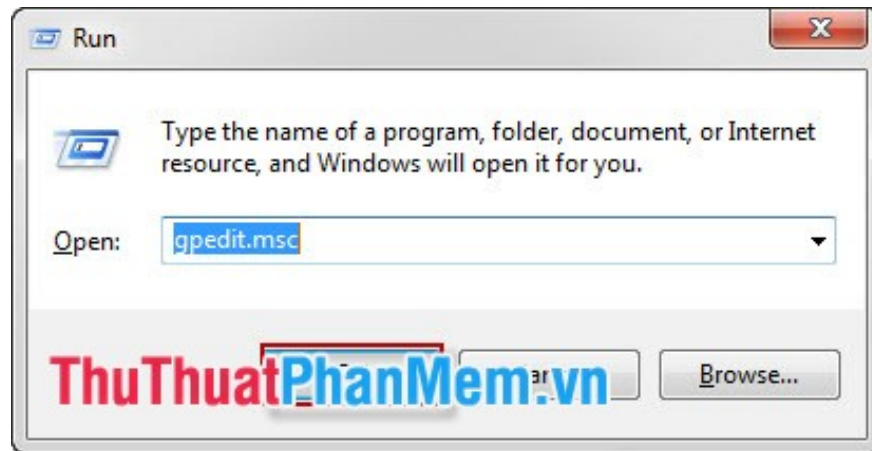

This article I will show you how to remove viruses, trojans manually on Windows 7 operating system in a simple way.

You discover that your computer is infected with some viruses, trojans, etc. But installing an anti-virus software consumes a lot of computer resources. Moreover, the virus scan makes your current job slow down and take a lot of time for the antivirus program to complete. So in this article I will show you how to remove viruses, trojans manually on Windows 7 operating system in a simple way.

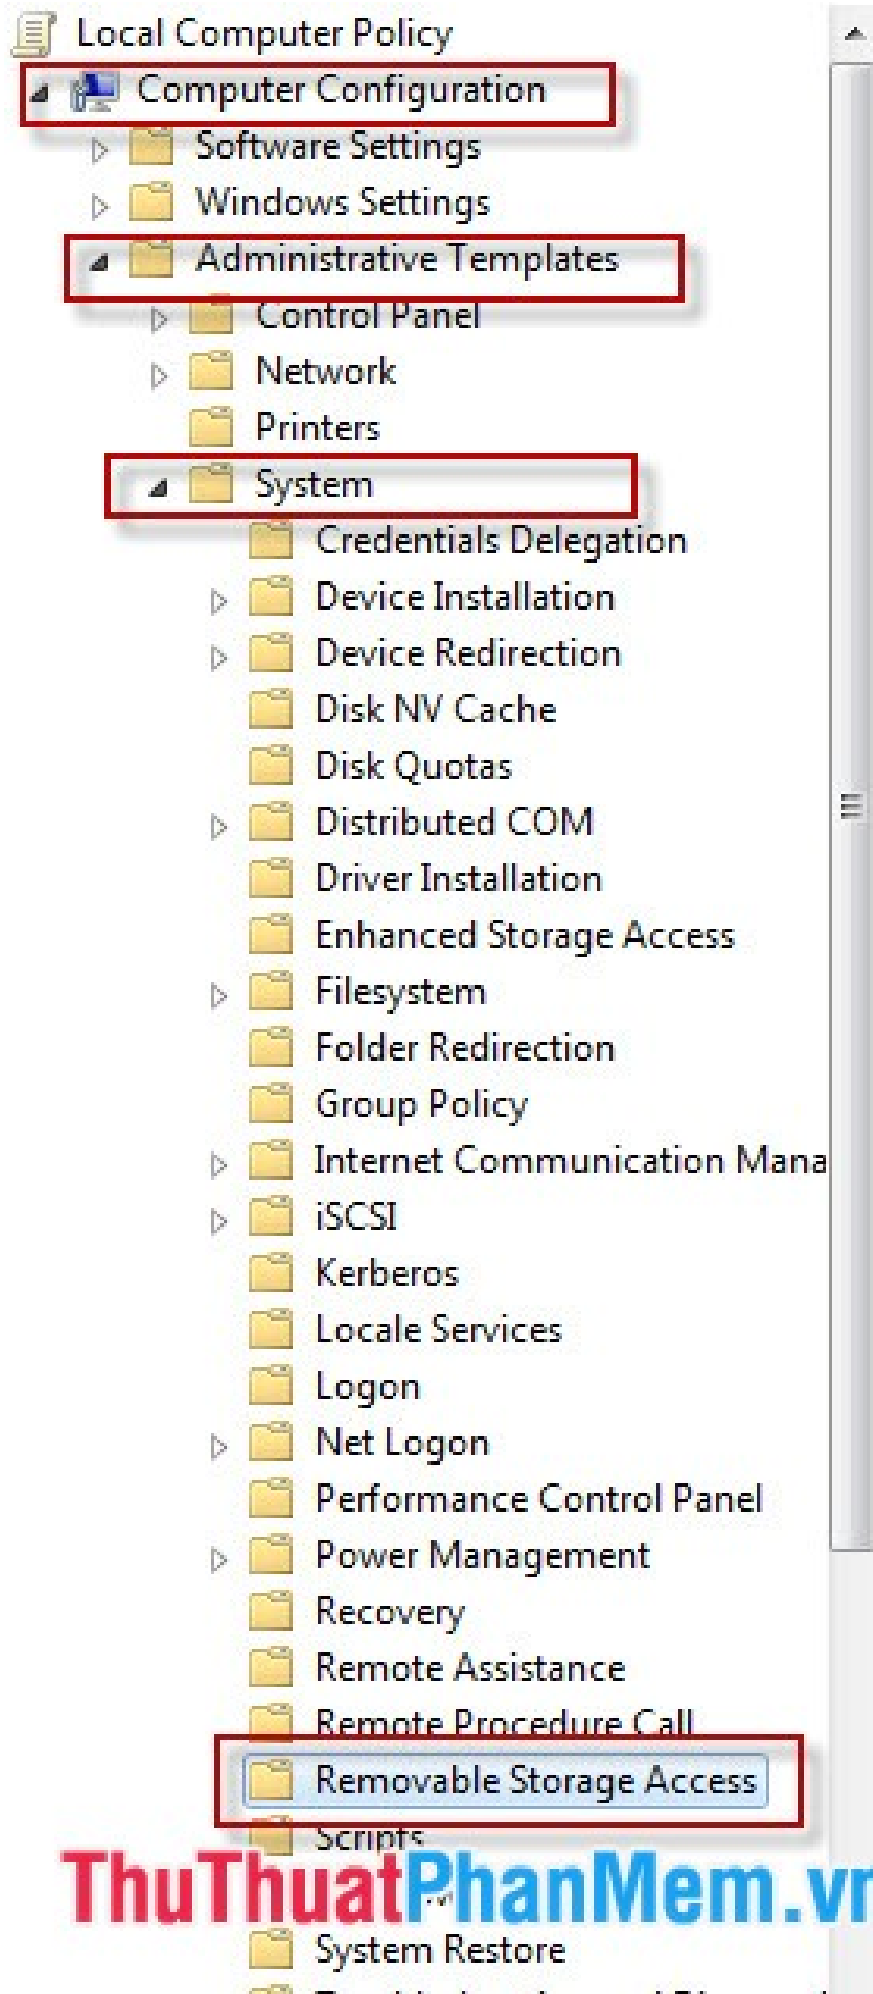

Step 1: Go to **Start**, type **Run** in Section **Search Programs and Files** , and select **Run** (or press **Windows + R**).

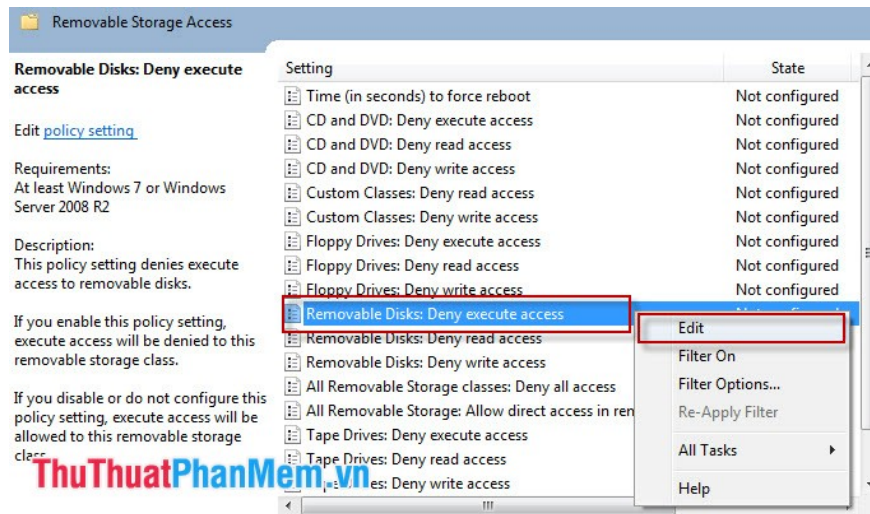

Step 2: Enter the keyword *gpedit.msc* in the **Open** field in the **Run** window and press **Enter** or select **OK** .

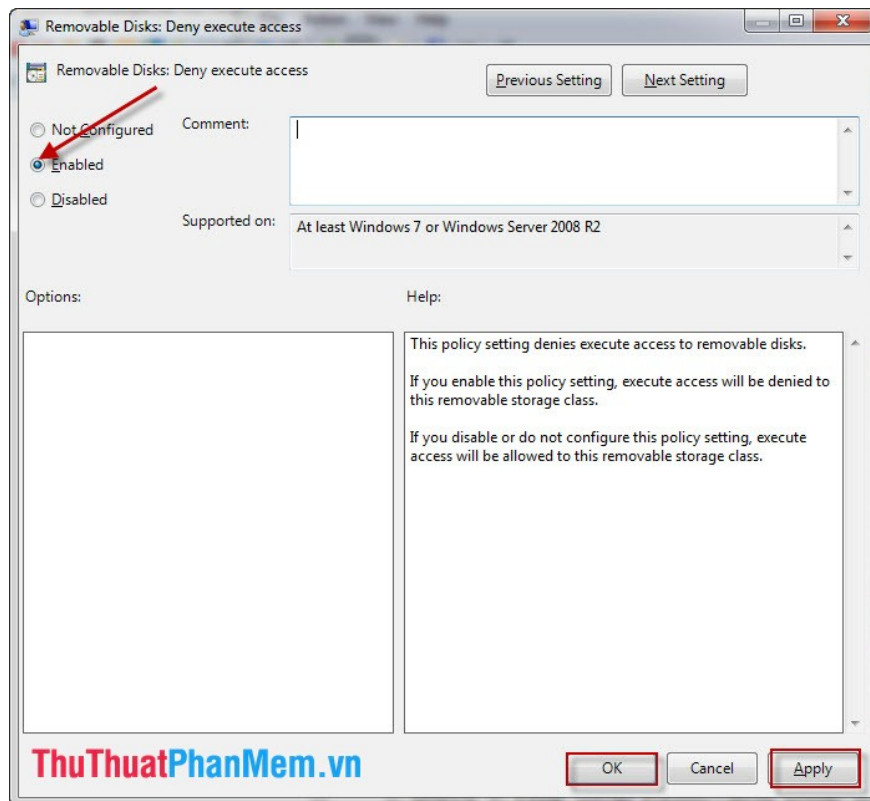

Step 3: In the **Local Group Policy Editor** window, click in the following order **Computer Configuration** -> **Administrative Templates** -> **System** -> **Removable Storage Access** .

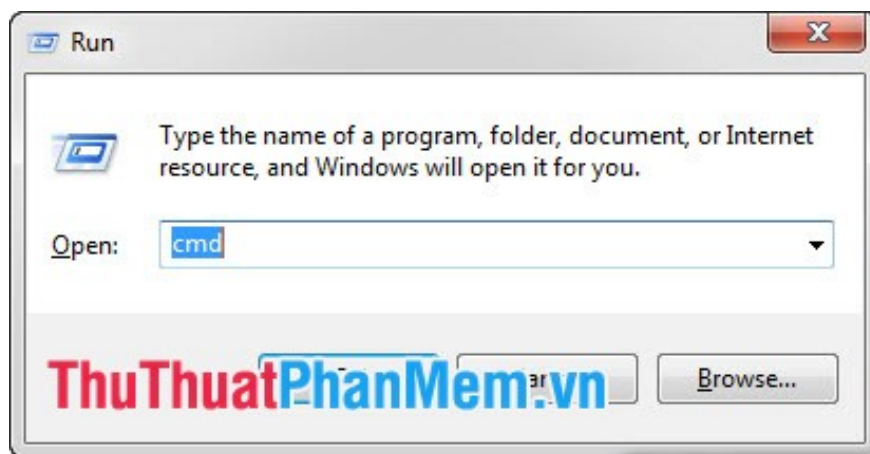

In the **Settings** section on the right, double-click **Removable Disks: Deny Execute access** or right-click on it and select **Edit** .

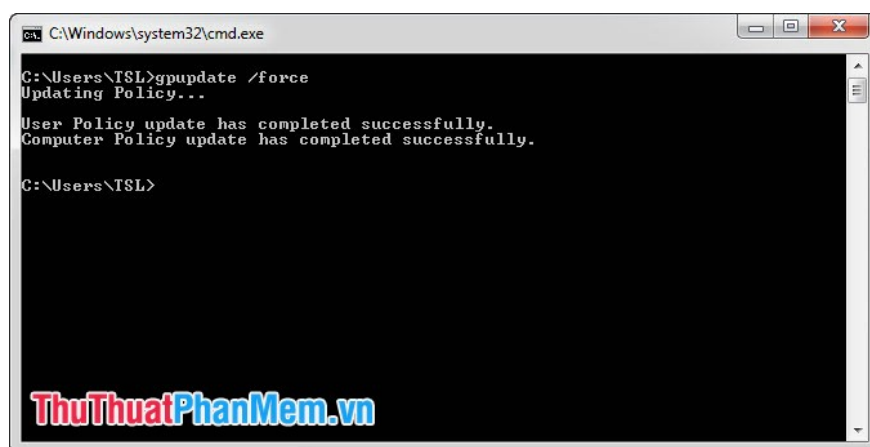

Step 4: The **Removable Disk** dialog box : **Deny execute access** appears, select the **Enable** mode and then click **Apply** then **OK** to complete the changes.

Step 5: **Restart** the computer, start the **Command Prompt** program by typing **cmd** into the **Open** section of **Run** .

Step 6: Enter the command `gpupdate /force` to automatically detect all viruses and trojans available on the computer.

A few notes that you need to know when using this manual method:

- Only kill viruses, trojans found on computers, devices such as USB, floppy disks, etc. cannot be removed.
- Only prevent viruses automatically spread in the computer. If the virus spreads by copying an infected file to your computer, you need to use antivirus software.
- During manual virus removal, the external storage device will stop working.
