

'Rescue' for Kaspersky blocked application

Kaspersky Internet Security 2009 version seems to be quite strange for many users due to the adjustment of the new interface system completely

Kaspersky Internet Security 2009 version seems to be quite strange for many users due to the adjustment of the new interface system completely plus the notifications generated when executing other applications. That's why it is possible for Kaspersky to accidentally lock apps on your computer.

The reason is because Kasperky has not yet determined the reliability of the application when executing the application, then you will accidentally click on the word 'Lock' or 'Not Allow'. as the application has been blocked by Kasperky.

One specific case is that Kasperky's computer is locked out of Internet Download Manager by Internet Explorer, and I can't download the file with this accelerator anymore. Now I have overcome it and please share it with you.

Conduct "release" for the application

At the main interface of Kaspersky, click the **Protection** item, now you should pay attention to the right, in the **System Security** section, click **Application Filtering** , then select **Settings** .

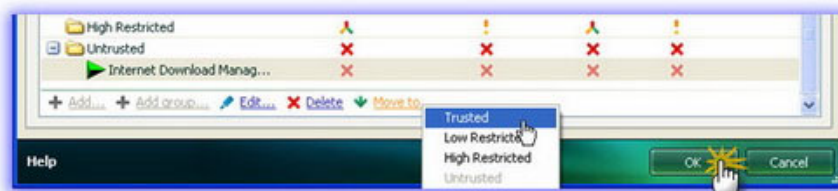

Protection window

In the **Settings** window, click the **Settings** button on the right (in Application Filtering frame).

Settings window

In the **Rules Settings** window, you will see a lot of folders, scroll down to find the folder called **Untrusted** . Any application that is accidentally locked will be in this folder.

Rules Settings window

To unlock the application (as shown in the picture is the IDM program), then click the application and then click on the word ' **Move to .** ', select **Trusted** , click **OK** 2 times to save the setting is complete!

You can do the same to "free" any programs that are accidentally locked by Kaspersky.

Besides, you can also put trusted applications in the **Trusted** folder so that Kaspersky doesn't stop asking when executing the application. By the **Rules Settings** window, click the **Trusted** folder, click the **Add** word and navigate to the application's .exe file and click **Open** . Click **OK** 2 times to complete!
