

# Revealing Apple's latest invention: The keyboard is made of glass and can be bent

Recently, Apple Insider has discovered a new patent of the world's largest technology company, showing a glass keyboard and feedback (as described) quite well.

There have been many interesting keyboard inventions that have been released in recent years. You probably still remember last year Lenovo launched a special Yoga Book. The device has two screens, the bottom screen will project a QWERTY keyboard layout and act as a virtual keyboard on the glass plane.

Although it may sound cool, but after actually testing, this keyboard contains quite a lot of problems. One of them is that it cannot provide proper feedback when typing and therefore, makes users make many typos when typing.

And Apple may have had a solution to this problem.

1. Apple will launch an over-ear headset this year, revealing its intention to acquire the universal headset market?

Recently, Apple Insider has discovered a new patent of the world's largest technology company, showing a glass keyboard and feedback (as described) quite well.

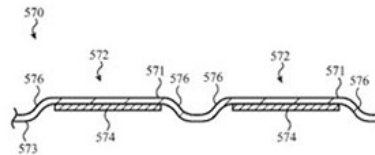

FIG. 5H

When a key is pressed down, it provides tactile feedback so that you feel that you have just successfully pressed.

In addition to its elasticity, it is also possible to bend the keyboard, making it more flexible to use.

This new keyboard is expected to bring better experience and input performance than the Butterfly keyboard currently equipped on the current MacBook.

The 'famous' Butterfly keyboard with easy-to-stick dirt under the keycap, leads to jamming keys, poor feedback keys, which greatly affects the user experience.

After receiving a lot of "stone tiles" from users, Apple has overcome the problem by adding a thin rubber film underneath the keycap to block dirt, but it leads to another incident of degree. The depth of the keys when pressed is reduced, in other words, the bounce of the key is affected quite a lot and the user is not satisfied with the problem.

1. Will Apple produce 'smart clothes' in the near future?

This new glass keyboard of Apple, if applied in practice, can completely overcome existing problems on a regular physical keyboard. We will no longer have to worry about jamming or dust accumulating between keys. That is not to mention that the glass keyboard can completely use longer time than the physical keyboard.

Do we really need a glass keyboard? Let us know your opinion in the comment section below!
