

Revealing the first image of iPad Pro with camera cluster is not for people afraid of holes

The new tablet may be announced in October.

It seems that Apple is preparing to launch several new iPad Pro with 3-lens rear camera system similar to iPhone 11 Pro. In fact, rumors of the iPad 3 camera have been around since the beginning of the year, but until today we have the first image of the device that will appear in the event taking place in October. Apple's.

In the image below, you can see the back of the new iPad Pro with a triple-lens camera cluster that looks very similar to the camera cluster on the iPhone 11 Pro, and this device is said to be "a complete design mockup". Sonny Dickson - who launched the image - previously revealed many photos of the iPhone 11 case.

If Apple really is about to upgrade the camera on the iPad Pro, we can confirm that its most expensive tablet will no longer lag behind the iPhone. Current iPad Pro models still use the same camera system as last year's iPhone XR, and the new iPad Pro with the same 3-lens camera system as the iPhone 11 Pro will allow users to shoot high-quality 4K videos, later. then edit them directly on the device.

A notable feature in the photo above is that the device does not have the glass coating on the back like the iPhone 11 Pro, and Dickson emphasized that this could be a change, or simply " *just a mistake. Small on a device that is intended for teasing the physical shape of the device.* "

We haven't heard many other rumors about the new iPad Pro, but Bloomberg has reported that both 11 and 12.9-inch models will receive similar upgrades to the iPhone, including new camera clusters and microphones. faster processing. With the iPhone 11 Pro already announced and more detailed reviews coming in, there's a high chance that new rumors and leaks about the iPad Pro 2019 will appear in the coming weeks. Let's see.
