

Rumors of the MacBook Pro will soon be equipped with Core i7

Many rumors have hinted that an upgrade to Apple's MacBook Pro may soon take place and they will be equipped with Intel's Core i7 chip.

Many rumors have hinted that an upgrade to Apple's MacBook Pro may soon take place and they will be equipped with Intel's Core i7 chip.

These rumors appear on the Nowhere Else website (France) and claim Apple will reveal the upgrade to the Macbook Pro line by equipping Intel's latest Core i7 chip.

Accordingly, the time to reveal will match the Macworld Expo event. This is an event that Apple often publishes its important products. Nowhere Else said, an Apple employee confirmed the existence of new laptops.

The Geekbench page has listed the details of the mysterious MacBookPro 6.1 system. The system is equipped with Core i7 processor (clock speed of 2.66GHz) and operates on the Mas OS X operating system not yet released (10.6.2 Build 10C3067, the current version is 10.6. 2 build 10C540). The current MacBook Pro is only equipped with Core 2 Duo processor.

Years ago, Apple used the Macworld Expo event to launch a large number of premium products, including iTunes, Safari, Macbook Air and iPhone. But there is no specific plan to reveal this product.

So far, rumors have appeared on Nowhere else's page, which is often evaluated with very high accuracy.

Therefore, it is possible to equip a Core i7 chip for the MacBook Pro line.
