

# Run Android 4.0.3 directly on Windows

WindowsAndroid helps launch the Android operating system just like a regular Windows software and supports almost all of the features of this OS.

**WindowsAndroid helps launch the Android operating system just like a regular Windows software and supports almost all of the features of this OS.**

WindowsAndroid application helps to run the Android operating system almost completely.

Previous Android emulator software like BlueStacks allows users to run Android applications but cannot launch the full interface. The newly introduced WindowsAndroid application suite has overcome this disadvantage, as well as running directly on Windows as a normal software.

Once installed, WindowsAndroid helps users to browse the web, view images and available applications and even install third-party applications as usual. The development team said the Davik virtual machine helped to support all Android applications as well as the ability to take advantage of Windows computer hardware, including graphics cards to speed up virtual machine hardware.

For touch-sensitive Windows computers, the WindowsAndroid software also helps to use a regular Android tablet. The version that this application is integrating is Android 4.0.3.

Currently WindowsAndroid software is still in the process of development and will soon be released to popular users in the near future.
