

Scabby hair with a 3 meter long sea worm has extreme hunting

Not only is it a huge length, this Bobbit sea worm also has an extremely terrifying way of preying on its prey.

There are thousands of different types of worms in the world but if you cannot see them with eyes, it is hard for anyone to believe in nature that there are giant worms up to 3m long. Not only is it a huge length, this Bobbit sea worm also has an extremely terrifying way of preying on its prey.

After learning about this particular deep-sea species, you will surely no longer think that the worm is a small, gentle, harmless creature.

The Bobbit sea worm is named *Eunice aphroditois* and is a prey species. They are aquatic animals of the Polychaete class, specializing in residence in shallow waters on the ocean floor.

Their bodies can grow to 3m long. When hunting, they hide the body long under the gravel, mud or coral, only the head is raised.

Their mouths are always open waiting for the bad prey to pass.

While ambushing, they use 5 antennae as antennas to detect and attack prey when they get close.

When the whiskers discovered their prey, it immediately jumped up and grabbed and bruised the lightning-fast prey.

In addition, this sea worm also possesses an extremely dangerous "weapon" to deal with prey. They can cut the bait in half with sharp teeth or use the hair on the body to inject poison that paralyzes the nerves.

If you just look at this picture, everyone probably thinks that this is a beautiful, brilliant creature, not an extremely dangerous predator.

1. Scary aquatic monsters specialize in "drilling" shark meat from within
2. Discover 5 strange creatures than even science fiction novels
