

Scientific evidence shows that reincarnation is real

For many scientists, reincarnation is only the belief of superstitious people and only in myths. Contrary to that statement, some reliable experts believe that reincarnation is a real phenomenon.

Reincarnation in general is a religious concept that dates back to ancient times, claiming that the soul, the soul, will not be dissolved after death, but transferred to a newly born child.

For many scientists, reincarnation is only the belief of superstitious people and only in myths. Contrary to that statement, some reliable experts believe that reincarnation is a real phenomenon.

Dr. Ian Stevenson, former president of the Department of Psychiatry and Neurology of the State and former Professor of Psychiatry at the University of Virginia Medical School, spent most of his career seeking evidence for reincarnation. Until his death in 2007, Dr. Stevenson announced that he had discovered more than 3,000 reincarnations in his day and shared that information with the scientific community.

In one of his researches called " *birthmarks and congenital malformations corresponding to wounds from deceased people* , " Stevenson used the identification to analyze the similarities between participants. rescued and the person who was supposed to be their previous incarnation and studied birthmarks.

Results showed that about 35% of children, who claimed to be able to remember memories of previous lives, had birth defects and / or birthmarks. Those 'signs' are thought to be related to the wounds on people that those children remember.

Scientists have studied 210 such cases.

Hypnosis usually occurs in areas such as: hypopigmented macules, hyperpigmented areas (hyperpigmented nevi), skin with less hair or wrinkles . Very rare cases There are birth defects.

In particular there are cases where the child recounts the life of the deceased almost always with the similarity between birthmarks and / or deformities on the child with the wound on the deceased.

According to medical documents that usually report autopsy, up to 43 in 49 cases have confirmed the correspondence between the lost wounds and the birthmarks (or birth defects) of the child. young.

Dr. Stevenson conducted another independent study when interviewing three children, asserting that it is possible to remember different aspects of previous life. Based on memories that have never been experienced in this life, each child gives 30 - 40 records of his past life. Through verification, Dr. Stevenson discovered that 92% of the above statements are true.

Articles by Dr. Stevenson were published in "Scientific Exploration" scientific journal.
