

# Selecting the right time, rays easily cut giant spider meat

Giant spider crab, also known as Japanese spider crab, is the species with the largest foot length among crustaceans, the length from these to more and more of them can be up to 3.7m, double height of an adult.

Giant spider crab, also known as Japanese spider crab, is the species with the largest foot length among crustaceans, the length from these to more and more of them can be up to 3.7m, double height of an adult.

1. The pursuit of killer whales kill the whales 12 meters long
2. Spider crabs compete to tear the octopus's corpse under the sea

Huge appearance with large body, 8 long legs, and relatively solid, sturdy shells of giant spider crabs can easily resist deep-sea enemies.

But giant spider crabs also have weaknesses, which is when they are molting. Then their new shell is very soft, so it cannot defend against the enemy's attack.

In the video, the stingray is very smart when choosing the right time the giant spider crab is molting to attack. At this time, the spider crab is entangled by the old crust while the new crust is still very soft to help the rays easily attack and flesh the prey.
