**These online file sharing services help you quickly send data, especially large files, to friends, colleagues or relatives without spending much time. You don't even need to register to open an account, just upload the file online and send the link to your friends.**

FilesOverMiles: With the ability to password protect files and has a fast file upload speed, FilesOverMiles is considered the perfect choice for those who need to send a sizable number of files while working.

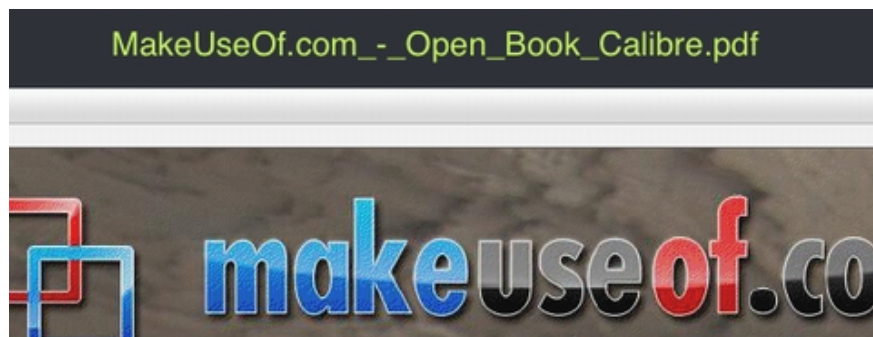

Pipebytes: This service will directly connect your computer to the person who needs to send the file to. You just need to select the file to send and send. The address to download the file will be sent directly to the recipient computer.

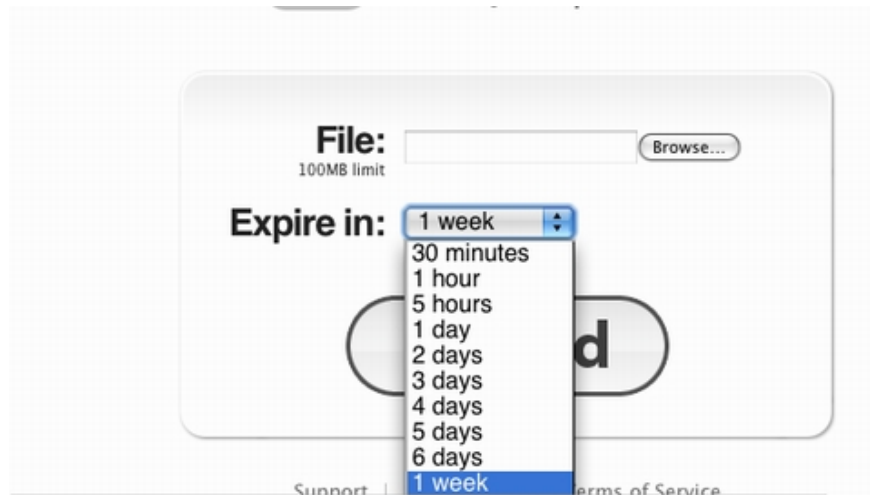

Jetbytes: This utility also directly connects your computer to the recipient computer. However, Jetbytes has a number of advantages over other similar utilities, which are simple, convenient interface and quick operation.

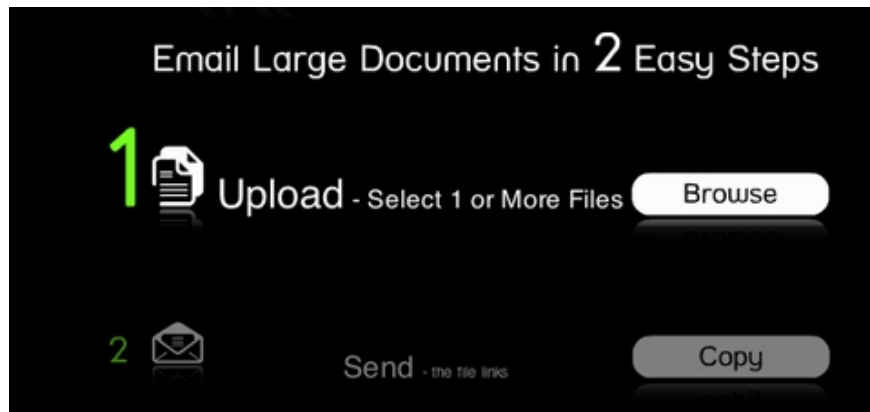

Dropdo: If you need to upload a large file that takes a long time, you should use Dropdo. This application not only stores files uploaded on the server but also provides the ability to preview documents for the recipient. Therefore, you can read other documents sent right on the network without having to download to your computer.

Senduit: Senduit's maximum send capacity is 100MB. The highlight of this utility is that you can set the mode to cancel outgoing documents if you don't want to save it on the network. During the file transfer process, if you accidentally close the browser window, the file will still be forwarded as usual.

LargeDocument: With a flash interface, LargeDocument can be difficult for some Macs or Linux, but it's fine with Windows. This utility is integrated with Gmail, so it is handy if you regularly work in Gmail and want to transfer large files.
