

Should babies use a nasal aspirator?

The nasal aspirator is extremely safe for infants and young children if used properly. The nasopharyngeal machine is extremely simple to use, will support the treatment of some very effective acute and chronic respiratory diseases such as sinusitis, rhinitis, bronchitis ...

Infants have very poor resistance because their bodies are still young so they are susceptible to respiratory diseases: mild manifestations are runny nose, cough. When the disease gets worse, it causes bronchitis, pneumonia or sinusitis. So what do parents need to do now? Take the child to the hospital for the doctor to examine and prescribe.

For respiratory diseases, most doctors often prescribe smoking with a nasal aspirator. So what is the nasopharyngeal machine that supports the treatment? Is the nasopharyngeal machine safe for babies? Today will help moms answer those issues in detail.

Why should nasal spray with a nebulizer?

In fact, compared to taking drugs or injecting drugs, the effect of a nasopharynx is quick and has fewer side effects.

In Vietnam, the weather changes erratically, with lots of dust and air. Acquiring respiratory diseases is inevitable. For children, the respiratory system is weaker than adults, when exposed to contaminated dust and smoke, the children will be more susceptible to respiratory diseases such as asthma, bronchiolitis, sinusitis, rhinitis, allergies, . causing many troubles, fatigue, discomfort for patients and people around.

Just use a nasal aspirator for 10-15 minutes, the children will feel much more comfortable. Meanwhile, it takes 30 - 60 minutes for the drug to be taken orally and it takes 15 - 30 minutes for injections to be effective. The effect of the nasopharyngeal machine can be seen quickly the first time it is used, is a useful product in the family, not only for babies and young children but also suitable for many users.

Omron nasal aspirator is used by mothers

When should I use a nasal aspirator?

Depending on the situation, the doctor will use the medicine to inhale differently. For example, respiratory allergies, sneezing, allergic rhinitis, asthma often use corticosteroids to prevent it. In cases of tracheal and bronchospasm in acute bronchitis, asthma will result in ventoline inhalation during acute attacks.

In children under 1 year of age, it is easy to get phlegm-induced bronchiolitis, then inhale aerosol with salt water very well to dilute phlegm, children are easily coughed and expel mucus from the body.

Countries that conduct nasal nasal sprays for infants and young children

1. Read the directions carefully before use.
2. Sterilize nasal aspirator before and after use.
3. The air condenser must be placed on a flat, fixed surface.
4. Next is to make the medicine into the cup. You must comply with the dosage and instructions of the doctor. Absolutely not mixed more or less.
5. Put the mixed medicine cup into the machine, put the mask and tube in place.
6. You have to keep the mask on your baby's face so he or she can breathe in a comfortable mask.
7. Once done, turn off the device and remove the mask, tube, medicine cup from the aspirator and clean it with warm water. Keep the accessories dry then store them for future use.
8. If the child does not stop crying or has an unpleasant phenomenon, remove the mask and turn off the device. Then try to coax your child to continue smoking when they feel comfortable and no longer cry.

Is it really dangerous to blow your nose and throat with a nebulizer?

Recently a lot of parents often call us and share that "why is my baby sniffing with a nebulizer and not feeling better", the expression is even more serious. This makes the mothers very confused. However, there are many causes of problems when using the device such as:

First: Choose to buy a phony machine, floating goods of unknown origin in the market

Of course, if you have purchased poor quality goods, all parts in the nasopharyngeal machine are not guaranteed, even harmful to users. This is why we recommend you buy at reputable dealers and ensure genuine products.

Second: When using, do not disinfect the machine properly

Do not clean, disinfect the nasal spray properly, causing bacteria to accumulate and when children inhale, it can cause infection, even respiratory failure. The best advice is to read the manual carefully before using.

Tuesday: Abuse of nebulizer

This is a very common situation in many parents, everyone wants them to get away quickly so everyone coughs and sneezes are pulling out. According to the manufacturer's recommendation, only use a nasal aspirator when ordered by a doctor.

Fourth: Use the wrong medicine

Many mothers and fathers voluntarily give their children a nose throat machine or take a prescription of the previous visit to help their child in subsequent illnesses without consulting their doctor about the dosage. This is also a cause for the disease of the baby can not even worse. Taking the wrong medicine is extremely dangerous, not just inhalers but all other medicines. The advice for you is to always let your child see a doctor before using a home smoking machine.

Thus, the main reason is due to users and consciously choose to buy products, people cannot blame completely because of the machine. Before using any type of machine, you also need to read the manufacturer's instructions and recommendations carefully. No matter how good a machine is, not using it properly is dangerous.

In summary, the nasopharyngeal machine is extremely safe for infants, children and adults. But before the storm, the mother must disinfect it very cleanly and the most important thing to note is to buy a genuine nasal nasal aspirator.
