

Silicon Valley engineers rushed to send their children to the 'old night school' for fear of the harmful effects of technology

One fact that is happening is that Silicon Valley professionals are educating, even forcing their children to 'quit' technology and attend a school that is isolated from technology even though they are trying to get users themselves. ' Addiction 'technology.

One fact that is happening is that Silicon Valley professionals are educating, even forcing their children to "quit" technology and attend a school that is isolated from technology even though they are trying to get users themselves. " Addiction 'technology.

The trend of "technology isolation" in Silicon Valley

The trend of "preventing" their descendants from using Silicon Valley engineers comes from the leading technology leaders such as Bill Gates, Steve Jobs and Tim Cook.

In 2007, after discovering that his daughter had fallen into a phone game, Bill Gates applied a "curfew" time frame to her family. Even then, after a while, the Gates family decided to show their children the phone when they were 14 years old. Meanwhile, the average age of a child owning a private phone in the US is 10 years old.

In 2011, Steve Jobs acknowledged in the New York Times magazine that he always limited the time to use his technology at home.

Even Tim Cook, the current head of Apple, shared that he did not allow his grandchildren to open a social network account. Even when interviewing, Tim Cook also recommends that users should not "use continuously"

Apple products.

One of the earliest investors of Facebook, billionaire Sean Parker also affirmed that he and the engineers tried to find ways to Facebook "as addictive as possible". He even said that it is difficult to determine its influence on the young mind.

1. Former Facebook president Sean Parker admitted to helping create a demon

Schools say no to technology

In the US there are 130 schools that adhere to the "Rudolf Steiner" educational philosophy, most of them are located around San Francisco and Silicon Valley, the area has a need for a high "technology isolation" environment.

The schools "Rudolf Steiner" always promote intellectual flexibility, the ability to judge independently, courage, morality . with the aim of directing children to be creative and responsible.

Here, phones, computers and laptops are prohibited, replaced by writing paper, pencils and blackboards. From preschool age, children were tasked with developing creativity, teamwork, solving problems and exploring the world around them with all five senses.

Technology is only used to teach middle and high school students, but time and subjects are also limited.

Annual tuition fees at these schools are quite high, almost double the national average, from US \$ 17,750 to US \$ 24,400.

Currently, the number of Waldorf schools increases continuously every year to meet the demand of separating their children from the technology of Silicon engineers.

Top technology leaders such as Alan Eagle - Google Communications Director, technology director eBay and senior employees from Apple to Yahoo have all sent their children to "Rudolf Steiner" schools.

Currently, many scientific publications have confirmed that young minds will be affected if exposed to "electronic screens". However, currently in US public school systems, smart computer systems, learning tables . are being used for all activities in the classroom.

Critics

However, many researchers argue that it is unreasonable to prevent children from interacting with technology equipment, because its effect on the brain is not as bad as the "rumor" public opinion. There are even opinions that continuously surfing the web helps to increase the ability to scan, summarize and capture information for users.

Some electronic engineers also claim that the foundation for their careers is created by being exposed to computers from a young age, if they are limited by their parents, they will not be as good as they are now. hours.
