

Silver batteries minimize the risk of explosion

With the end of Dell coming to Apple to recover the laptop battery recently because of the risk of explosion, Zinc Matrix Power chose a 'prime' time to offer the product. Zinc Matrix Power, a strange name in the technology village, announced it is preparing to launch a rechargeable battery

With the end of Dell coming to Apple to recover the laptop battery recently because of the risk of explosion, Zinc Matrix Power chose a "prime" time to offer the product.

Zinc Matrix Power, a strange name in the technology village, announced it is preparing to launch a rechargeable battery made from silver and zinc.

Under its commitment, new batteries are completely free of lithium and liquid liquids with a risk of explosion. Matrix Power said that silver-zinc batteries were developed on aqueous solution.

If so, it will not only eliminate the risk of fire, the new battery will also be easy to recycle (because it does not leak toxic chemicals). And yet, Matrix Power claims twice as much silver-zinc battery life as lithium-ion batteries.

Zinc-silver batteries will be officially released next fall and can be used for both laptops and mobile phones. With all the advertising producers, this battery seems promising. But anyway, advertising is just advertising. Let's wait and see.
