

Simple way to transfer data from Android to iPhone

Backing up your contacts, synchronizing your music, video and image data ... takes a lot of user time when switching from Android smartphone to iPhone, but now things have become so simple. Please refer to our detailed instructions below.

Backing up your contacts, synchronizing your music, video and image data . takes a lot of user time when switching from Android smartphone to iPhone, but now things have become so simple. Please refer to our detailed instructions below.

1. Things to know when backing up with iCloud
2. How to transfer data from old iPhone to iPhone 6/6 Plus
3. How to backup data on iOS?

Backup calendar, email, contacts

Although the iPhone runs on iOS platform, an operating system is completely different from Android, but it is still quite compatible with the Google account. You only need to log in to your Gmail account on your iPhone and you can continue to use Google's essential services.

To do this, follow these steps on iPhone: Select **Settings > Mail, Contacts, Calendar > Add Account > Google** and sign in with your Gmail information and password. You will then be asked to select the services you want to sync, including: **Mail, Contacts, Calendar** and **Notes** . The remaining task is now extremely simple, just press the slider to the service you want and wait for the settings to be set up.

If you save contacts in Android device memory, you can still transfer this data to iPhone. Most Android phones can export the stored contact information as a **vCard** (.VCF) file. The first thing to do is you have to find the **Export** option on your Android smartphone. Depending on the Android device used, this feature may be placed in different locations. Typically, this option relates to the settings in the Contacts application. You choose this function, the output file will be stored in the internal memory of Android phone.

Next, you send the **vCard** file to your personal email (*you can install file management applications like **ASTRO** or **ES File Explorer** on Android to attach files to mail*) and open with **Contacts** on iPhone. After completing this step, you will be able to view or enter the personal contacts contained in the vCard file.

Back up text messages and call logs

Transferring text messages from Android phones to iPhones is a complicated process. To do this, you need to use a phone manager that is compatible with both operating systems.

You can use **Moborobo** software (very easily confused with Mobogenie). This is a software that successfully transfers text messages from Android phones to iPhones.

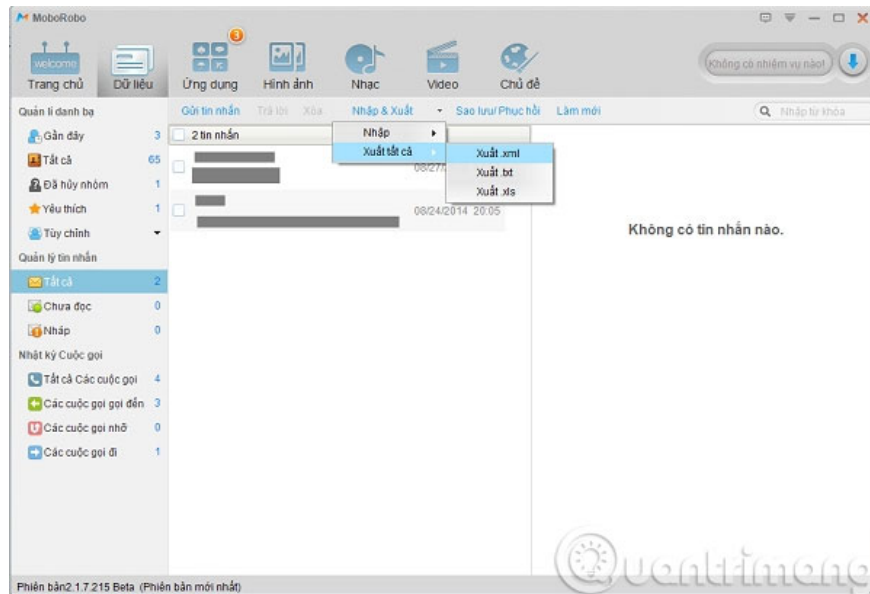

Download and install Moborobo software to your computer.

Connect your Android phone to your computer via USB. Be sure to enable **USB Debug** mode, in **Developer options** on Android device.

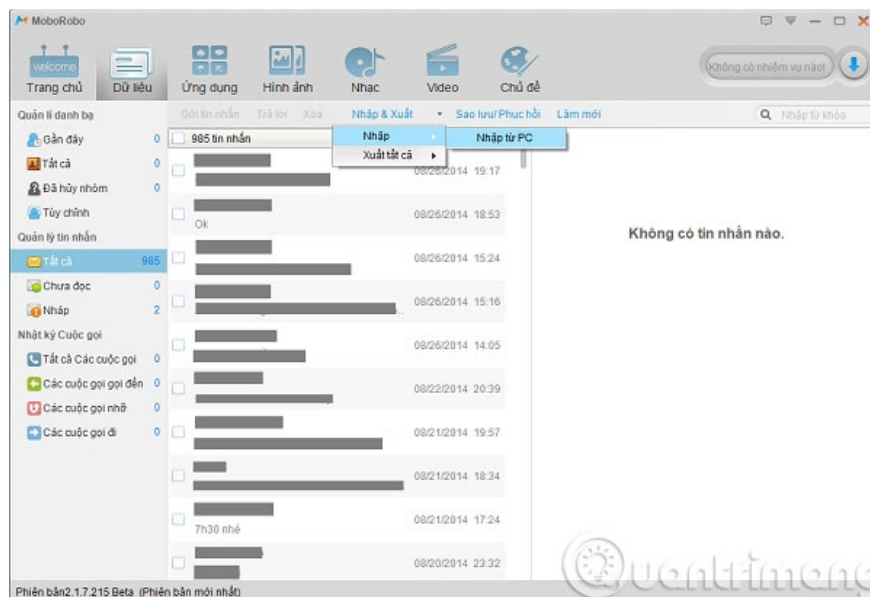

On the Moborobo interface, select the **Data** tab. In **Message management** , select **All** then go to **Import & Export > Export all > Export . XML** (other XML data types will not be accepted by iPhone database).

Connect iPhone to computer via USB and import the created XML file.

After iPhone reboots, you will see all Android messages will fit in the default Messaging application of the device.

The process of backing up call history from Android to iPhone is even more difficult. The requirement is that you must have a jailbroken iPhone device. First, you can use Mobarobo on your computer to export phone logs on Android as text (.TXT) or Excel (.XLS), or use the Call Logs Backup & Restore application on Android to send calendar call history in an XML file. Next, take the same step as step 4 above and wait for the "miracle" to arrive.

Backup multimedia data

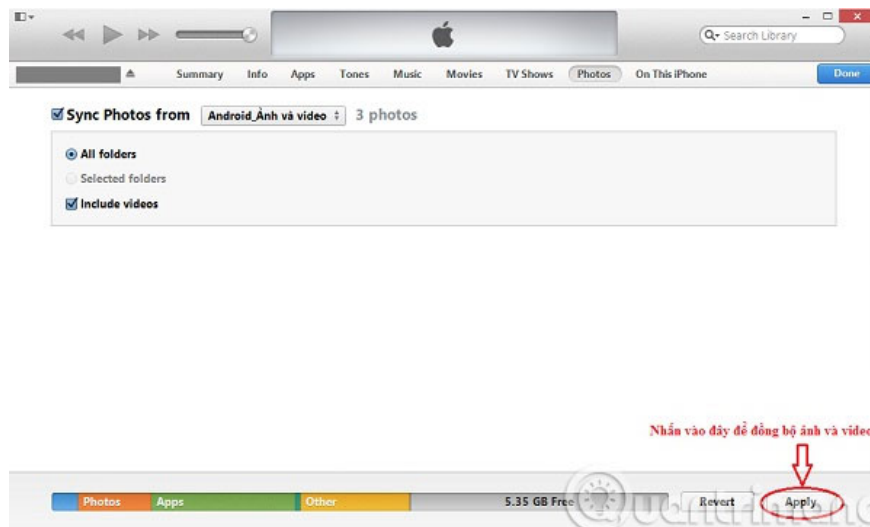

Transfer data by copying and pasting is incorrect views. The reason is because the multimedia library on iOS is managed through iTunes software. You can download this software easily and for free from Apple's official website.

After that, you perform the transfer of image and video data to iPhone:

First, copy photos and videos from your Android device (*usually in the DCIM drive*) to an empty folder on your computer. You connect your iPhone to your computer via USB and turn on iTunes (*if it doesn't start automatically*).

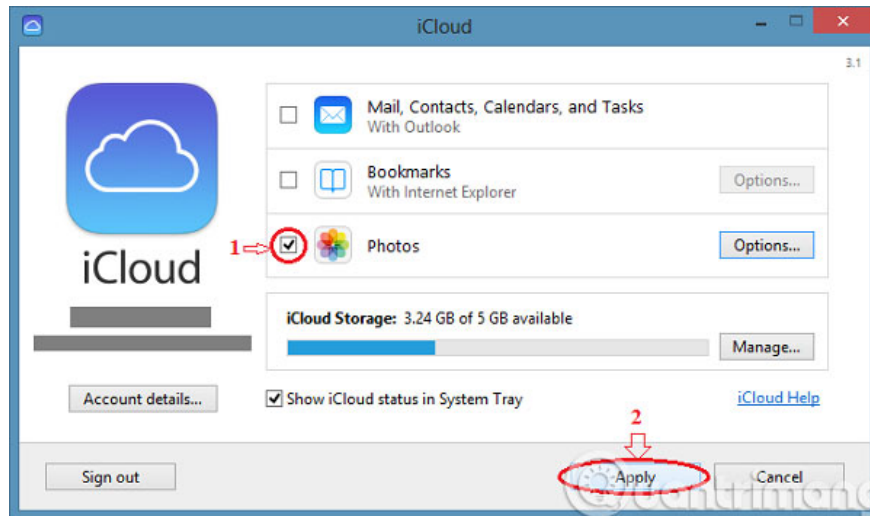

In the iPhone tab (*top right corner of iTunes*) you choose **Photos** and then **tick Sync Photos , Include Videos** from the saved folder on your computer and press **Apply** (*lower right corner*).

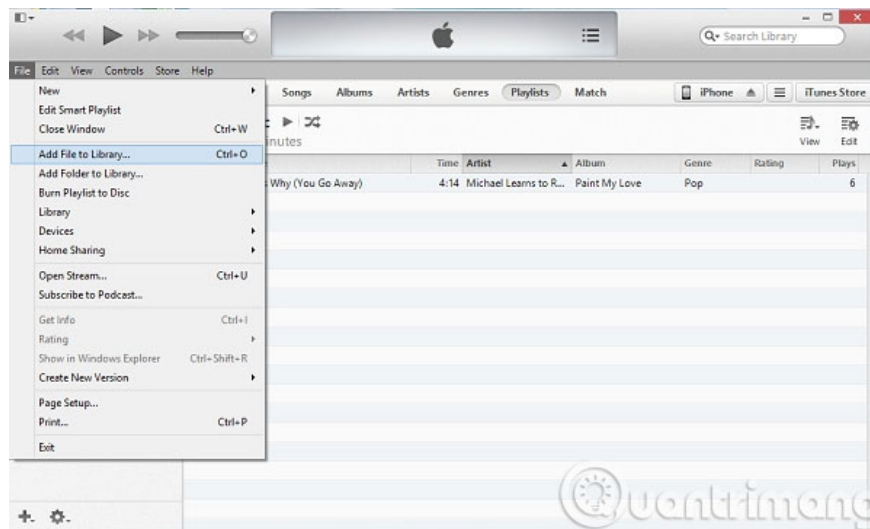

You must not disconnect the iPhone until the synchronization process is complete and the data is completely transferred to the device.

In addition, you can also use some of the simpler methods to store photos and videos with cloud **apps** like **Google Drive** , **Dropbox** , **OneDrive** on Android or iCloud on Mac or **iCloud Control Panel** software on Windows and use the same applications on iPhone to sync stored data. However, these ways often depend heavily on the network speed and storage space you have on cloud applications.

If you want to backup songs from your Android device to iPhone, you need to copy the songs into a separate folder on your computer. You put these songs into the iTunes library by: Select the **File** tab > **Add File to Library** (or press the key combination *Ctrl + O*) and select all the songs in the folder you just stored.

You connect iPhone to computer via USB port. In the music library, to add each song individually, find the **Add to** options section next to your favorite song and add it to the iPhone. Or, go to iTunes' **iPhone tab** and select **Sync** to sync multiple songs at the same time.

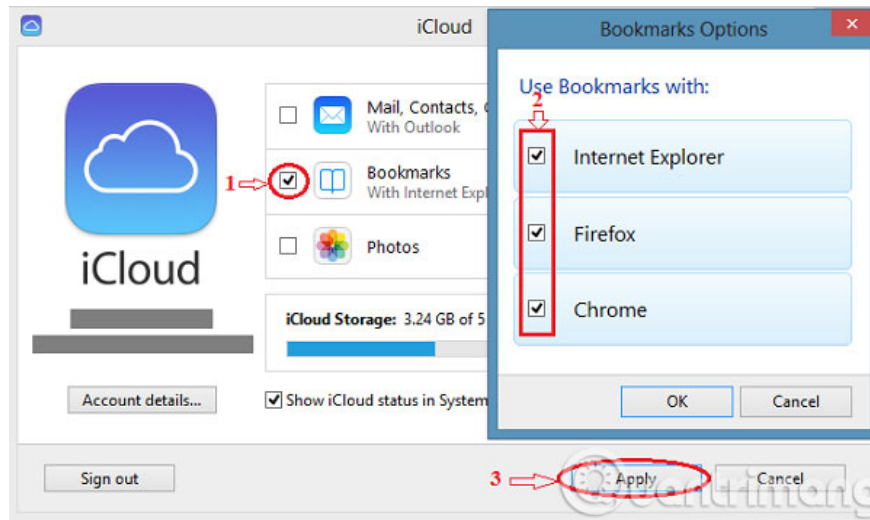

Back up the Google application

In fact, Google's applications not only work on the Android platform, but also on the iOS operating system. Therefore, if you are familiar with **Google Maps** and **Google Chrome**, you can still download them to replace the default **Apple Maps** and Safari browser applications.

Backup bookmarks from Chrome, Firefox, IE to Safari

Apple's iCloud Control Panel software has the ability to synchronize bookmarks between browsers quite well. Therefore, you can use them to do this very easily.

Good luck!
