Features of SpaceSniffer

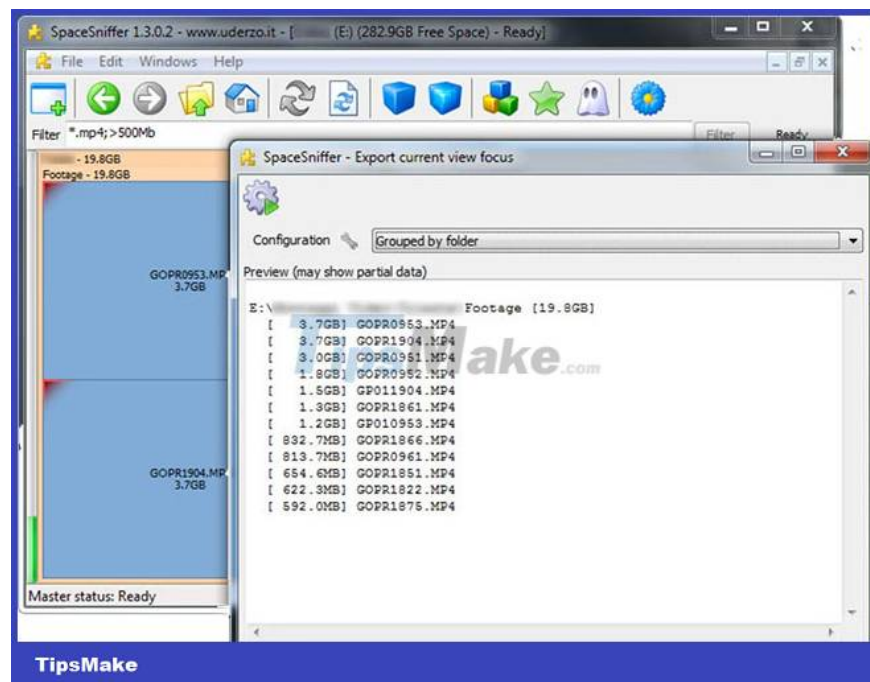

Real-time monitoring, fast file scanning process!

With SpaceSniffer, you will have a good idea of how space is allocated in your Microsoft Windows PC. Advanced features

The latest version of the program comes with several file classes, allowing you to add different colors to file types. For better image tracking, the program uses the Drop Shadow feature on the selected on-screen element. The Folder name mask filter gives you greater control over file distribution. Additionally, export tags come with drive size, cage level, and date. Similarly, create, access, and modify directives have been added to the File age filter.

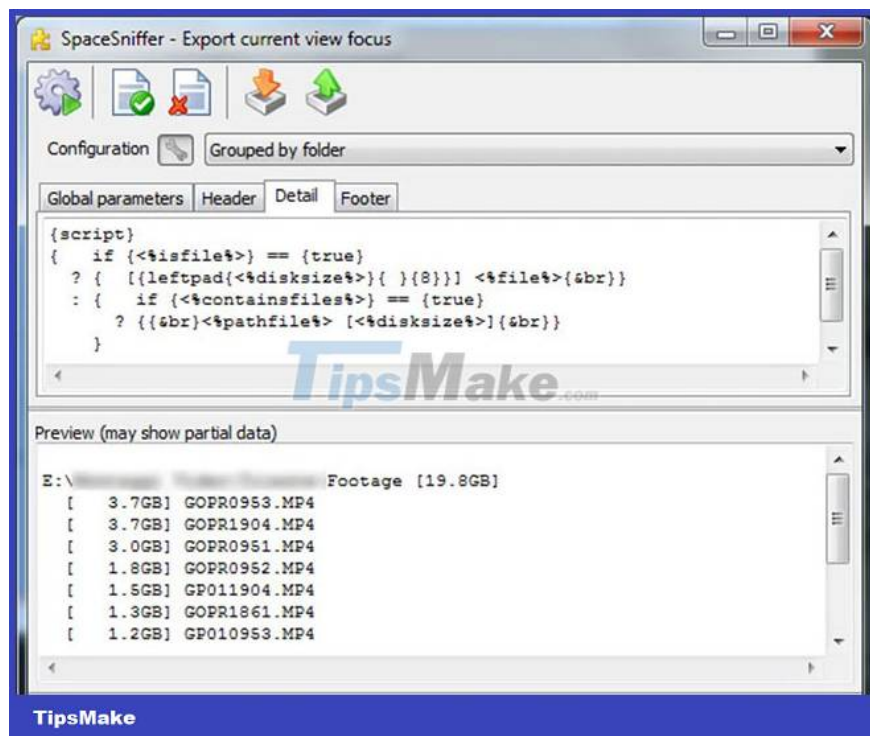

To parse filter directives, the developer has added an efficient algorithm. For better performance and response, the DynaSmooth option has been added. There is also a Rescan function that improves performance. SpaceSniffer also has an efficient file detection and modification algorithm, allowing for clear display of custom information.
