

# Speed ??up Android, tips to speed up 3G Android phones

How to speed up Android, increase the speed of your Android phone when it is running slower than when you first bought it. Of course, slow Android running will greatly affect the time as well as the use of features on Android devices.

When investing in a new smartphone, you always hope it will run fast and smoothly throughout the entire usage process. However, that is not the case. You will have to face a series of crashes, freezes or stutters after a period of use, and now you will need to know how to **speed up Android** and increase the operating speed of your phone.

In the previous article, TipsMake showed you how to **increase Android battery life** , but in this article, let's see the measures to **speed up your Android phone** , speed up 3G, make your Android phone run faster and better.

Speed ??up Android, tips to increase 3G speed on Android phones

## ***1. Restart the device***

If your device often freezes or runs slowly, the first thing you should try is to turn it off and restart it. This is a small thing but it helps your phone a lot. Therefore, before performing other operations to help your Android device run faster, please restart the device first.

## *2. Update phone applications*

The reason your Android device runs slowly may be because you haven't updated to the latest versions. To do this, go to **Settings -> About Device -> Software update** to check if there are any new updates. Update to the latest versions to speed up your Android device and run smoother.

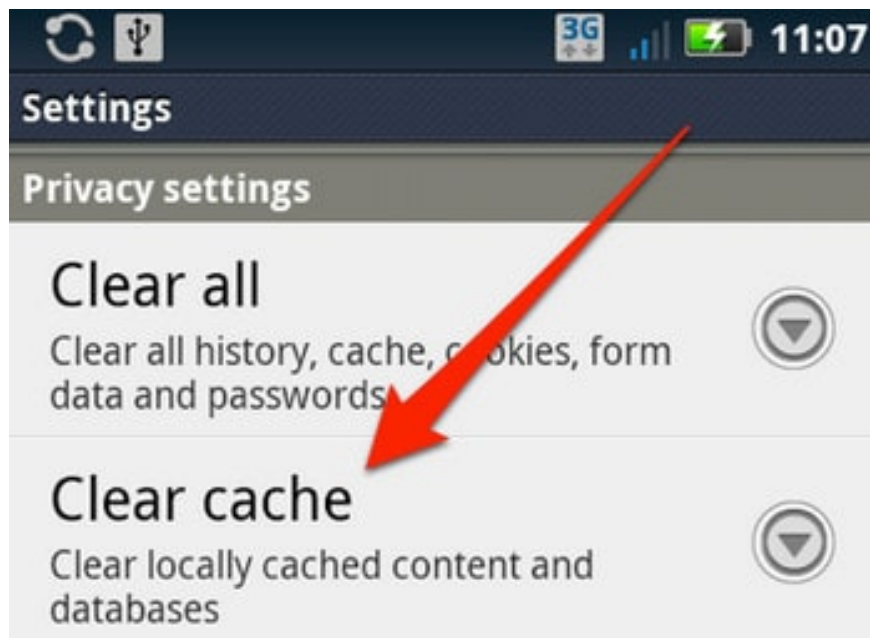

## **3. Delete unused data**

If your phone is still slow, delete unused data and files such as old songs, old pictures, or old documents,.Deleting unused data helps increase device memory and increase the running speed of your Android device.

#### ***4. Delete cache data of frequently used applications***

During the process of using an Android device, some applications will generate cache data to increase performance. This sometimes leads to an overload of system memory, causing device processing to become slower due to lack of memory. Therefore, you should regularly delete cache data to reduce the load on the system.

Please go to **Settings > Storage > Cached data**.

#### ***5. Install new ROM***

When installing any ROM, you will basically replace Android system files with new files with new features. Because Android is open source, anyone can modify it. CyanogenMod and AOKP are the two most popular ROMs. If you use an old Android phone and do not support updating to new operating system versions,

installing a new ROM allows you to run newer software on the phone, while also speeding up the device. However, you need to note that you must 'root' Android to install the ROM and will void the warranty.

#### *6. Limit or disable background data*

Another reason why phones run slow is that they use data in the background. Limiting or disabling it not only improves the speed on your device but also helps you reduce your data bill each month. Go to Settings > Data Usage, scroll down to see which apps are using data in the background.
