

Stephen Hawking revealed the AI ??artificial intelligence solution that dominates people

Surely all of us know that the speed of human biological evolution cannot match the speed of technology development, AI's artificial intelligence. So what if artificial intelligence can replace people working in the future?

Surely all of us know that the speed of human biological evolution cannot match the speed of technology development, AI's artificial intelligence. So what if artificial intelligence can replace people working in the future?

Watch for AI

None of us can deny that Stephen Hawking possesses one of the greatest minds in modern society and of course many people pay attention to what Hawking says (*through support systems*). *pronunciation*). Recently, Stephen Hawking focused on a specific aspect: the future of humanity.

Stephen Hawking has expressed his views on issues related to extraterrestrial life to *artificial intelligence (AI)*, which humans created themselves on this Earth by system AI artificial intelligence system. Later, Hawking became more cautious and wary of AI. Hawking is not against the development of artificial intelligence technology.

In fact, Stephen Hawking also said that AI artificial intelligence " *will either be the best, or the worst thing that happens to mankind* ". Although believing in a brighter future of powerful AIs with the ability to enhance human brains like Stephen Hawking and many others still worry about the bad effects AI AI brings.

Stephen Hawking warns that AI will affect the average human job market and, along with Tesla CEO Elon Musk, Hawking drafted a set of 23 rules to protect humanity from AI - issuing orders Prohibit the development of AI robots used in the military. Stephen Hawking also expressed concern about whether the AI ??will dominate this world or worse will end human existence on Earth. Stephen Hawking answered *The Times* newspaper: " *The fight against this uprising, the creation of 'some forms of world government' may be controlled by technology .*"

Hawking explained his reasons for the need to have an international regulatory body:

" Since the civilization of humanity began, colonial aggression has become very useful because it creates a clear survival advantage. It has deepened our human genome with Darwin's theory of evolution However, at the present time, technology is so advanced that the invasion process can destroy all of us with nuclear or biological warfare. the ability to inherit from this ancient time by logic and reason "

Vision

In order to catch up with AI artificially - something that humans create, we need to increase our adaptability. " *The development of artificial intelligence can cause humanity to perish. It will develop itself, redesign itself to an amazingly high level. Humans, species are limited by speed. The slow evolution of biology, impossible to match them, and then humans will be replaced,* " Hawking said in 2014.

Even so, Stephen Hawking does not think that the advanced machines of the future will destroy people for certain emotional reasons. " *The real risk of artificial intelligence is not from their malice, but from their own ability. An extremely intelligent AI artificial intelligence system will accomplish its goals in a complete way. good and if that goal is not like us, people will be in big trouble .* "

According to Stephen Hawking, the above reason points out that we need a certain management organization that is able to adapt quickly and aggressively. That is what humanity needs to survive the booming era of super-intelligence, of AI systems created by people themselves.

Fortunately, we also have a number of research institutes dedicated to solving these problems. Those research institutes, including the Institute of Artificial Intelligence Collaboration or the Ethics Institute and the Artificial Intelligence Fund Ruler, have begun to develop, research frameworks, detailed guidelines for creating create a

safe, standard AI system. The *Institute of Electrical and Electronics Engineers (IEEE)* also published the first " *guidebook* " for artificial intelligence.

And Stephen Hawking is not only worried about the future human destiny, because he is still optimistic that " *even though everything looks dark, I'm still an optimist. I think humanity will be get up, face those challenges* ".
