

# Steps to check iPad battery status quickly iPad

iPhones have a built-in tool to check battery health, but iPads don't. This article will show you how to check your iPad's battery health simply, quickly and for free using specialized third-party software like coconutBattery and iMazing.

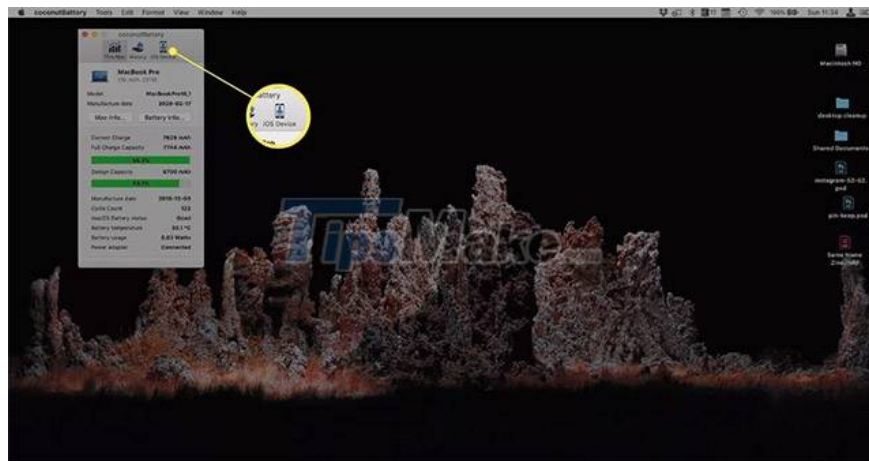

## Check iPad battery health with coconutBattery app.

If you want to quickly check the health of your iPad's battery (and do the same for your Mac), CoconutBattery will be a great help. Just do the following simple steps:

Step 1. Download, install and open the [CoconutBattery](#) app on your iPad.

Step 2. Connect iPad to your Mac. If you upgrade to CoconutBattery Plus, you can connect via Wi-Fi.

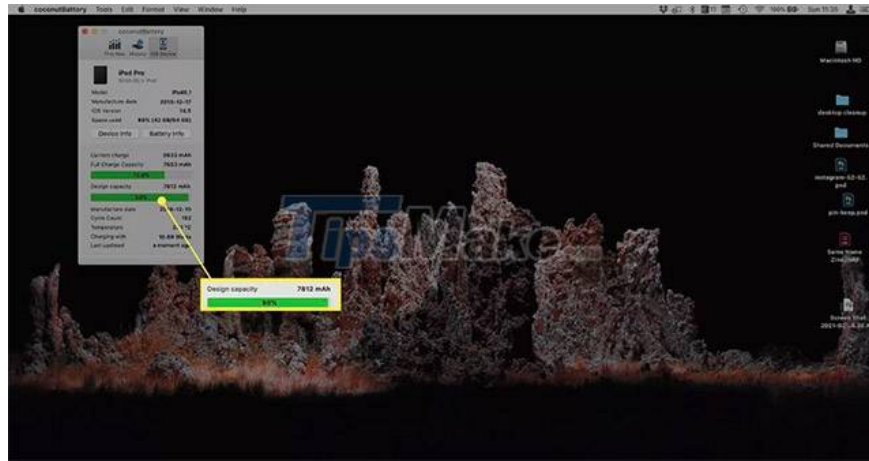

Step 3. The first tab will display information about your Mac's battery health. Click iOS Device to check your iPad's battery status.

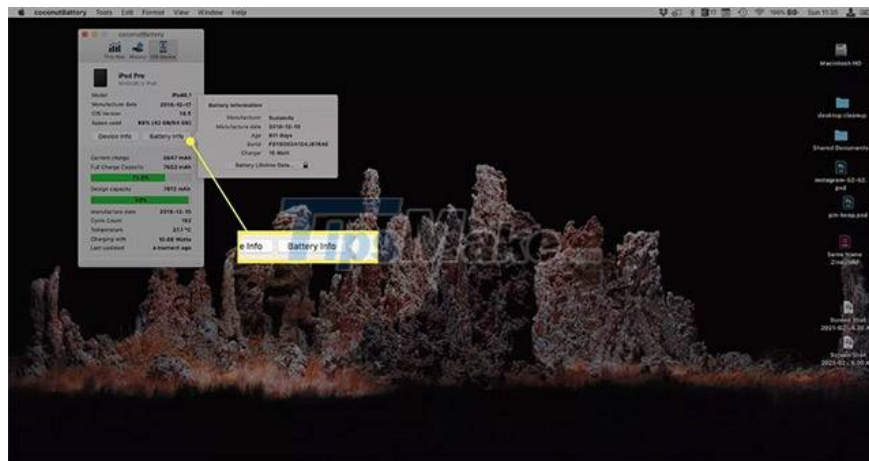

Step 4. CoconutBattery will provide you with all the valuable data related to iPad battery. However, there will be 2 main parameters that you should pay attention to to most accurately assess the battery status on your device: Design Capacity and Full Charge Capacity.

Design Capacity can be understood as the maximum charge that the battery can hold when brand new, measured in milliampere (mAh). While Full Charge Capacity is the maximum charge current the battery can reach.

Keep looking at the status bar below the Design Capacity section. The closer the number is to 100%, the better your iPad battery is. When this number drops below 80%, consider replacing the battery with a new one.

Step 5. Another useful information you should be interested in is Battery Info. Clicking here will tell you the battery's brand, manufacture date, and more.

## Check iPad battery health with iMazing . app

iMazing works similarly to CoconutBattery but provides more useful information. Usage is as follows:

Step 1. Download, install and open the iMazing app.

Step 2. Connect iPad to the Mac or PC you're using.

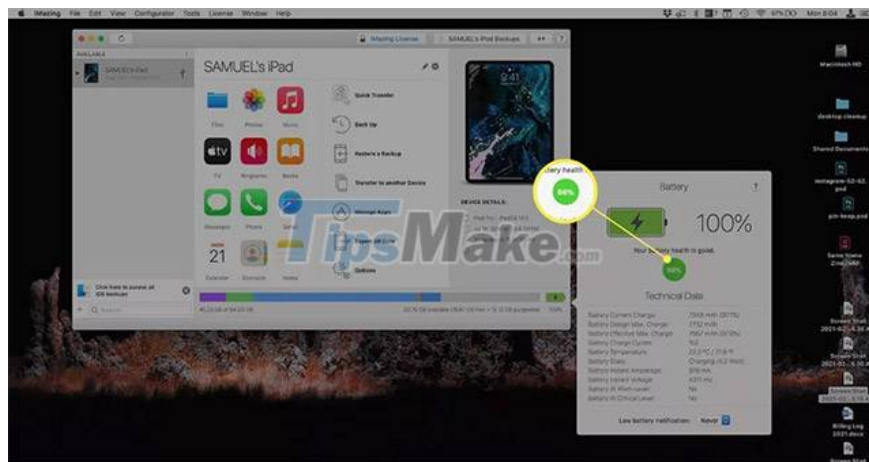

Step 3. Click on your iPad in the left sidebar.

Step 4. Click the battery icon to display battery statistics.

Step 5. iMazing will immediately display clear information about the battery health on your iPad, and provide a percentage correlation between the current capacity of the battery compared to the original design capacity without the battery can still hold (the closer to 100% the better).

You can also get more detailed information about the original design capacity, current capacity, charge cycle, temperature, warnings and more.
