

Steps to optimize Pocket PC

Anyone who has ever used a Pocket PC must understand the amazing capabilities of this handheld device. But to understand and fully exploit the performance of the Windows Mobile Pocket PC operating system (PPC), not everyone knows. Here are the steps to maximize PPC speed.

Anyone who has ever used a Pocket PC must understand the amazing capabilities of this handheld device. But to understand and fully exploit the performance of the Windows Mobile Pocket PC operating system (PPC), not everyone knows. Here are the steps to maximize PPC speed.

Turn off unused applications

By default programs run on Windows Mobile when closed (click the Close button), it still runs in the background of the system RAM. This multitasking ability of PPC is very useful. However, when too many programs are running, the processor must be more active, memory is consumed more. If overloading can lead to slow, even causing hangs.

You can go to **Settings > Memory** and then select the **Running Programs** tab to see which programs are running on the system, if you want to close the program you choose and click **Stop** (or **Stop All** if you want to close all).

You can also use the powerful *Task Management* programs and the **Close** button variable to close the program completely like Pocket Plus (www.spbsoftwarehouse.com) or Wisbar Advance (www.lakeridgesoftware.com). These are the top 2 award-winning software voted by PocketPC magazine.

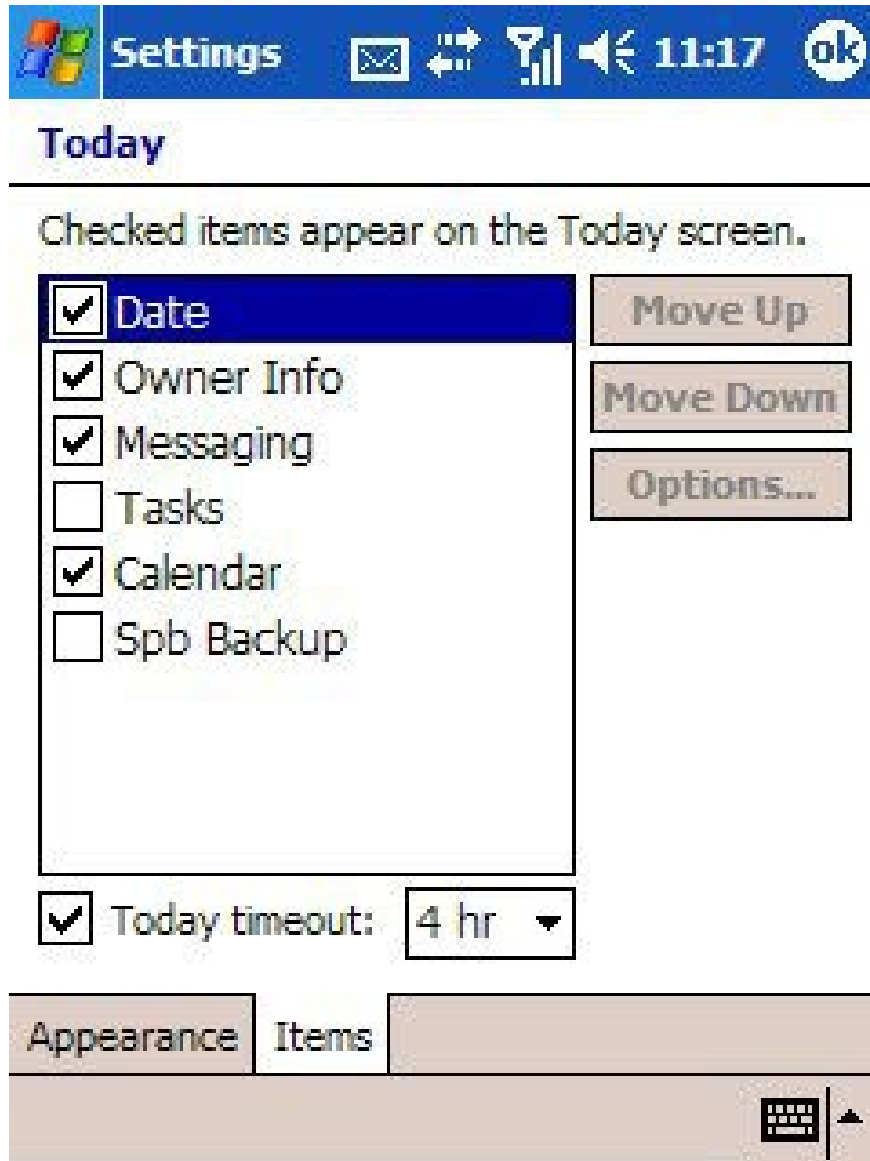

Remove unnecessary parts on the Today screen

The Today screen is the center of Windows Mobile. With smart display, just glance over, users know their jobs like date (Date), calendar (Calendar), Message and email (Messaging), notes (Note) .

However, due to the characteristics of each job, not everyone needs a Today screen to display all of the above functions to avoid distractions and distractions. Not only that, but all of the parts that are displayed make the limited resources of Pocket PC a little less.

That is not to mention that there are many Today Plugin programs (the software installed for the Today screen). While there are many useful features, these programs consume a lot of RAM, causing the machine to boot and slow down, especially with older PCs with modest configuration.

Your first thing is to see what you need, if it's a PPC Phone (with phone integration), there must be a section on Messaging, if you're an entrepreneur and interested. To PDA function (personal support), you should leave Calendar out. Many programs also create Today Plugin, if necessary, you can keep it, otherwise put it into the 'remove' list.

Go to **Settings** > **Today** > select **Tab Items** . It will display a table of sections displayed on the Today screen, want to choose which part you want to hide, or uncheck it. Done, click **ok** , now reboot, you have seen the speed of the PPC has improved markedly.
