

Strange: Pumping car tires with fire

Flammable substances (liquid or gas) are sprayed into the rim of the vehicle and then ignited. The high pressure makes the tire from falling quickly become tense and the tire adheres to the rim without a specialized machine.

This is a way to use fire to inflate for automobile tubeless tires when lacking specialized high-capacity machines.

Flammable substances (liquid or gas) are "watered" into the rim of the vehicle and then ignited. The high pressure makes the tire from falling quickly become tense and the tire adheres to the rim without a specialized machine.

How to pump this car tire is 1-0-2 quite dangerous, there is a risk of high accidents. If the tire is old, worn or cracked, it will not stand up to the sudden high pressure that could cause a big explosion. In addition, the amount of air generated is not controlled, which may exceed the need to make the tire too tight to cause other consequences to ride.

So you just watch for entertainment but absolutely should not try in any way to ensure safety.
