

Strange story underneath a lake in Minecraft

A Reddit user with the nickname Idkwhattowastaken recently shared a Minecraft screenshot of nine Iron Men underwater.

Mojang has brought Minecraft many updates over the years. Iron Golem was added in version 1.2.1 along with Wild Cats, and they often appear around nearby villages and forests.

Iron Man is a character that will protect the Villagers as they go around their living area and they are responsible for protecting the villagers from those who threaten them. Players can also create Iron Men to protect villagers and themselves by placing 4 blocks in combination with Pumpkin Lanterns or Pumpkins.

You must place the block closely in a T shape and keep the Jack-o-lantern above your head to transform into Iron Man. They can cause great damage to threats around the player such as Zombies, spiders, skeletons.

A Reddit user with the nickname Idkwhattowastaken recently shared a Minecraft screenshot of nine Iron Men underwater. Even though they are trapped underwater, they are clearly not affected at all, at this point they can completely become useful allies of the player.

Iron Golem can be used in enchantment or to make dyes. This player confirms that the body of water found is near the area where this player lives. In order for Iron Men to spawn, your village needs to have 10 or more residents, and one of them must be a worker.

Because the coordinates are not visible and gamers have not asked clearly, it is currently unclear at what depth these mobs are stuck. Because Iron Golems cannot swim, they will get stuck at a certain depth. Although Iron Man cannot swim, players can rescue a trapped Iron Golem in a number of different ways.

You can build additional blocks below the water right under Iron Man's feet so they can go to the surface. Build the boxes in a ladder shape so they go up, or build a wall to block the water, then use a sponge to absorb the water in the space the Iron Golem is in. Finally, if all the water flows into one area through a hole, filling the gap can prevent liquid from entering.

While unable to protect Villagers if in these positions, these Ironmen can sometimes attack Drows. BECAUSE Idkwhattowastaken has not provided further information, it is unknown whether these Iron Golems will be saved or not. The fact that they are alive shows that the Iron Golem is not damaged by water, just as the Iron blocks will not rust if you immerse them in water.
