

## Strange: The woman 'gave birth in the coffin' after being buried

In a strange case, a group of archaeologists discovered a woman's bone with a bore in her skull and fetal bone between her legs found in a new report.

In a strange archeological case, archaeologists discovered the bones of a woman with bore holes in her skull and fetal bone between her legs.

According to a report in the Daily Mail, researchers from Ferrara and Bologna universities said the two skeletons are a testament to a 'birth' case in a coffin after a closer analysis.

They also said that the child's leg bone might still be stuck out of the pelvic cavity, but the upper body and head had leaked out.

According to the researchers, the woman is between 25 and 35 years old and 38 weeks pregnant. Maybe in the 7th or 8th century AD.

According to the report, the researchers believe that the drill hole in the middle of a woman's skull can be an ancient medical method of surgery to treat all types of diseases by drilling or cutting. into the skull. They said that the woman's bones even showed signs of healing through the intervention markers, indicating that the woman survived at least a week after the procedure was performed.

Researchers say that the discovery of abnormal surgery and the birth of a baby in a coffin like this is very rare.

This study was published in World Neurosurgery magazine.
