

Strangely, people with 45% burns are healed quickly with stem cell therapy

A 45-year-old man, who suffered burns of up to 45% due to the spill in his work, was recently healed by stem cell treatment, authorities at a hospital in Mumbai said.

A 45-year-old man, who suffered burns of up to 45% due to the spill in his work, was recently healed by stem cell treatment, authorities at a hospital in Mumbai said.

Ram Naik (name changed) was taken to StemRx Bioscience Hospital in Mumbai city after another local hospital moved. Nearly 45% of his body suffered severe burns due to chemical spills during work.

Accident has caused serious, serious complications, clearly shown on the face as well as the whole body. In addition, the joints also weakened. The skin on the outside burns badly, the area of ??the burn surface to level II, even the burn area to level 3 because the burn has deeply destroyed the subcutaneous tissue.

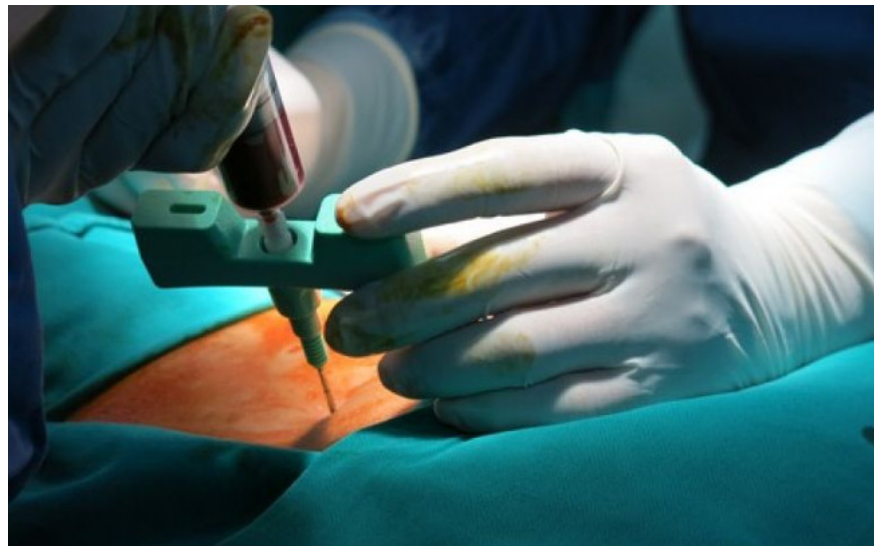

According to doctors, in cases of severe burns, the factor of time to treat and control scar tissue plays a very important role in the treatment.

The team of doctors said that currently, stem cell therapies have been used recently to treat burn injuries. It is proven not only to heal wounds but also to heal wounds, prevent inflammation, prevent scarring from developing and some other skin sclerosis.

So this time, doctors decided to treat stem cells for Naik patients.

Health recovery researcher at Pradeep Mahajan Hospital said, within two days, there was a marked improvement in the patient's condition and the occurrence of inflammation and necrosis began to decline markedly.

' The eyelids have been recorded that can be opened, so are the mouths. The explanation for this positive expression may be due to growth factors in platelet-derived therapy, fibroblast cells, and collagen collagen .

Mahajan said: *" Blood transfusions and supplements are also continuously injected into the vein to maintain intravascular balance, health for patients with enough strength to absorb therapy ."*

On the 5th and 6th days after treatment with stem cell therapy, harmful facial skin, lesions began to flake off, the team also observed that new skin quickly formed after a week of treatment.

As usual, this method takes more than 8 weeks for patients to heal and for many more months so that patients can regain joint and facial movements.

" On the 10th day of the treatment, dry skin completely peeled off and on the 14th day the patient did not have any aches and pains, the light movements were also flexible, more stable and free, the skin was also restored quickly recovered and we believe that within a month the treatment will quickly end if nothing happens and the patient will return to normal, "Mahajan said.

Medical scientists also say that such fast-moving cases are difficult to control the true recovery value as well as control the weakening of therapy after a long time. In addition, it does not exclude the possibility of complications, infection of the skin system is also very high.

However, according to the medical group, by using stem cells, the body will recover itself with the body's natural self-healing ability, leading to a reduction in healing time and promoting regeneration. affected tissue. This will also reduce the mental injury and financial burden that patients have to go through.

Mahajan said: *" Stem cell therapy offers a new and powerful strategy for controlling and treating burns and wound management. Thus, stem cells have demonstrated great potential in Enhance wound healing and facilitate skin regeneration "*.
