

# Tech Tasks Small Businesses Should Outsource

IT outsourcing will allow you to get a high-quality website and promotion at the initial stage without having to hire a full-time programmer. In the future, when the business starts to grow, you can outsource the automation of all internal processes.

*Offshore website development* came about when businessmen all over the world began to move their projects online. Not all companies can afford to pay a full-fledged staff of programmers. **Small business IT outsourcing** successfully copes with this task.

## Benefits of outsourcing

One of the ways to optimize costs when starting a business is to outsource the tasks. It allows you not to hire expensive specialists to the staff of a newly created enterprise, but to attract them to perform specific tasks. In this case, large fixed costs turn into smaller variables.

Tasks that are not core to the team take up a lot of time and effort, throw off focus, reduce enthusiasm, and often cost more to solve them. Attracting external contractors allows you to relieve the main project participants and the manager, outsourcing allows you to focus on your core competencies, that is, on what can bring money and ensure the break-even point is reached.

Another big plus of outsourcing is the ability to pump business processes through the expertise of involved specialists. Observing the work of professionals allows the leader to form the image of a competent specialist in a particular area. This will come in handy at the stage of recruiting your own employees. IT outsourcing teams most often offer employee training and technical support for the finished product.

## What functions do companies usually outsource?

By resorting to *outsourcing services software*, companies can bring their sales online or automate internal processes. Most often they automate:

1. Accounting and tax accounting;
2. Transport and logistic;
3. Maintaining a client base and accepting applications;
4. mass communications and marketing (implementation of artificial intelligence for collecting and analyzing big data).

## When is outsourcing needed?

Outsourcing is necessary when the business owner needs to free up resources and focus on core business processes. Everyone should do what they do best. One of the basic principles of effective division of labor is fully applicable to companies. Outsourcing gives you the opportunity to focus on what constitutes a competitive advantage.

## Small business outsourcing

Outsourcing is a tool that is suitable for small businesses, start-ups and microenterprises. At the beginning of the journey, a business is often a group of enthusiasts or even just one person with an idea. Most people are competent in one or two areas. But there are many issues to deal with when running a business.

Suppose a businessman makes custom-made cakes. Advertising on the Internet is now one of the most effective. Be sure to do the following tasks:

1. Design a site and put it in the top of search engines;
2. Maintain pages on social networks and recruit followers so that as many people as possible know about the business;
3. Organize the procurement and supply of raw materials, as well as the delivery of products to customers;
4. Maintain accounting records.

And if you can cope with the last two points at the initial stages without automation, then you will still need a qualified specialist to create a website. It takes a lot of time to maintain social networks, take photos and videos, and edit. If one person does all this, when will he have time to bake the cakes?

IT outsourcing will allow you to get a high-quality website and promotion at the initial stage without having to hire a full-time programmer. In the future, when the business starts to grow, you can outsource the automation of all internal processes. And in order not to miss calls and requests, we recommend to automate work with clients from the very opening by introducing CRM into the work of the site.
