

The 15-year-old was nearly shot with blind eyes because he broke his iPhone battery to explode

A 15-year-old Australian boy after deliberately breaking an iPhone battery to explode to see if anything inside was lucky only minor burns. If the battery explodes near the eyes or a few drops of acid shot into the eye, he may be blind.

A 15-year-old Australian boy after deliberately breaking an iPhone battery to explode to see if anything inside was lucky only minor burns. If the battery explodes near the eyes or a few drops of acid shot into the eye, he may be blind.

Jay Watson said that he was in the bathroom and sitting on an iPhone battery. There was nothing to do because he didn't bring his phone, he bent the battery to see what's inside. Suddenly, the battery exploded, golden light flashed and fire burst out. His skin was burned by acid on his chest.

The protagonist of the battery explosion said, he should have used Google to answer his questions, but when he thought of this, he was already on the ambulance.

The above exploded battery is from an iPhone 6s, it has been removed but not in the phone.

His mother, Kari Lashbrook, after hearing her son's screams, immediately called an ambulance. Jay Watson was immediately taken to Royal Brisbane and Women's Hospital. Thankfully he only suffered burns on his skin.

In this iPhone battery explosion, the user error is not the manufacturer's or the phenomenon of self-explosive battery. Due to the internal components of the battery, manufacturers have issued warnings about the harmful effects of damage to the battery.

Jay's mother said that having light skin burns is an appropriate punishment and a lesson to remember for Jay.
