Why is Windows 7 antivirus software so important?

There have been many articles about the best antivirus software for Windows 7.

As you know, Windows 7 is one of the first versions of Windows that comes with available antivirus software, called Windows Defender. Although Defender is good, it's not perfect.

Windows Defender is software developed by Microsoft, which means it will only update its virus database whenever you allow Windows PC to perform major updates.

In other words, your computer can be updated after 3 months, 6 months, even 1 or 2 years, compared to other major manufacturers' databases, and at risk of being infected with viruses Latest.

If you regularly store passwords, credit card information and other sensitive data on your computer, you may be at risk of hackers getting into and stealing those sensitive data.

Different viruses have different goals, but according to the design, they are used to break into the machine and block information from being transmitted when you connect to the Internet.

If you are completely relying on Windows Defender to protect your Windows 7 computer, you can become a victim of identity theft and other issues that hackers cause.

A high-quality antivirus software can help you protect in ways that Windows Defender cannot do, and will update itself regularly to ensure the computer is always protected.

It will also encrypt information stored on the computer, such as credit card numbers and bank account information, so even if hackers have access, they cannot decrypt what was found. .

High quality antivirus software will prevent you from downloading, accessing malware and websites, by scanning all the programs you try to download and install, as well as the websites you visit to play. Show hidden threats.

The best way to ensure your Windows 7 computer is protected is to use separate antivirus software, along with Windows Defender or replace it.

Method of testing antivirus software Windows 7

To check the effectiveness of each antivirus software, the article will use Anti-Malware Testfile.

Testfile (specially designed to test virus and anti-malware detection) is not a virus or malware, but contains code to activate anti-virus and anti-malware software, to warn users about potential threats.

Testfile is currently the only software package available to test anti-virus and anti-malware software because Spy Car's tools are no longer developed.

How to evaluate the performance of antivirus software?

Criteria 1: Is it easy to use?

Some of the 'best' antivirus software available are difficult to install, providing too many confusing options to configure and make your computer difficult to use regularly.

In this article, suggested software has been tested to ensure that they are easy to install and configure, and do not create any frustration when used.

Criteria 2: Does the manufacturer provide a refund policy?

Although the recommended software in the article has been thoroughly tested, it is possible that the reader does not have the same experience with the author.

If the experience when using the recommended software in the article does not satisfy you, make sure you can get money back and install another company's antivirus software on your computer.

Criteria 3: Can you protect multiple devices?

Many existing antivirus software will allow you to protect every device you own with a single purchase.

However, some companies will require you to pay for each additional device. This will be a problem when you have multiple computers.

To ensure that you don't waste money or spend more money than you really need, the article will appreciate software that can protect multiple computers for a single fee.

Criteria 4: Does it slow down your computer?

One of the users' biggest complaints about antivirus software is that it slows down the computer when scanning for new threats or checking the software being installed.

Each different service in the list has been checked to determine the consumption of system resources when scanning for new threats or updating databases.

Any software that causes your device to be slow, unresponsive, or even restarted at random times will be ranked lower on the proposed list.

Criteria 5: Does it produce false warnings?

Unfortunately, some antivirus software are too sensitive and cause too many false alarms for objects that are not really a threat.

These false alarms may cause some users to think that their computers are infected with a serious virus.

The software provided by each service has been checked to ensure that the number of false alarms is minimal. Software that does not generate false alerts is of course ranked higher on this list.

Criterion 6: Does it protect the computer against Zero Day attacks?

You will be able to rely on antivirus software and keep your computer safe from threats that are being developed daily by hackers.

Make sure that the antivirus software you install on your device updates itself and protects you from the latest viruses or viruses that cannot be identified.

The best antivirus software for Windows 7 today

Now, it's easy to see that checking existing antivirus software is a "heavy" task, but can't be overlooked.

After testing each software of different services, the article found 3 services that outperformed competitors to confirm the top position today.

Each company provides quality antivirus software and has comprehensive protection listed below.

Avast Security - 9.4 / 10 - The best antivirus software for Windows 7

Avast Security is an excellent service that passes the tests and confirms the top position in today's list.

Advantages

The software that Avast Security has developed is simple to install and configure, as well as being convenient to run in the background. It seems invisible until you need it.

Whenever you want to subscribe to BullGuard, you only need to provide your email address, which means you can protect every device you own just by re-entering your email address, when you install a copy. Why new software.

While testing Avast Security's software, it's easy to see that it doesn't slow down your computer, even when installing software and running tests on known malware like Testfile.

Avast Security also does not generate false alerts when users access many different websites.

The Avast Security development team is very crowded and strives to maintain its database, as well as protect its customers against the latest threats.

If you find yourself having problems with Avast Security when you have it installed on your computer, the company also offers a 60-day trial option so you can get your money back and try another service.

Defect

The only weakness with Avast Security is the lack of support for ransomware threats.

Conclude

Whether you are using antivirus software to replace Windows Defender or have them work in parallel, Avast Security also offers the best protection available.

If you are looking for the best antivirus software for Windows 7, you should use Avast Antivirus.

BullGuard - 7.9 / 10 - A quality alternative if Avast Antivirus is not suitable

If you find that Avast is incompatible with your device or causes a problem, BullGuard may be an alternative to keeping your Windows 7 PC safe.

Advantages

BullGuard is also very simple to install and configure. After paying and installing it on your computer, your system will be protected after a few minutes.

Sometimes there are also false warnings when checking websites and when installing software, but compared to other antivirus programs, this rate is quite low.

You can protect multiple computers with the same subscription, so if you own many different computers, you won't need to pay separate fees for each computer. This saves you a lot of money.

BullGuard developers work quite aggressively to maintain a database of the latest threats, and BullGuard does a great job in determining its Zero Day threats.

Defect

BullGuard has caused a few problems during testing, mainly while scanning for new threats already on the machine and when trying to install other large software.

BullGuard has a shorter refund policy than Avast, but they always follow the policy set.

Conclude

When you are trying to protect your Windows 7 computer, Avast is currently one of the best. However, if the Avast software does not work properly on your computer, BullGuard may be a worthwhile alternative.

Kapersky - 6.7 / 10

When you want to protect your Windows 7 computer, there are far better services than what Kapersky Labs currently offers in their antivirus software.

Advantages

Kapersky software is very simple to install, and it allows you to protect your device within 15 minutes after paying registration.

Defect

However, when installing the software, the tested computer began to encounter problems, making it difficult to introduce Kapersky as a viable antivirus software for readers.

Kapersky software causes many problems when installing new programs and scanning to check for existing threats.

Although Kapersky allows you to register your account with an email address, if you want to protect more than one PC with the same email address, that could be the problem.

There are many false warnings given by Kapersky.

Kapersky Labs does not currently offer a refund policy, but they allow you to try the software for 7 days to make sure it works with your computer.

Conclude

Up to this point, it is difficult to advise readers to use Kapersky as a viable solution to protect their computers.

Whenever your Windows 7 computer is connected to the Internet, you are at risk of being attacked and hijacked by hackers.

To ensure your computer and sensitive information are securely protected from hackers, you need to use antivirus software better than Microsoft Defender built-in.

Wish you find the right choice!
