

The best security tools for 2010

Although only in the third quarter of 2009, but so far, most security companies have released version 2010 for their security tools.

Although only in the third quarter of 2009, but until now, most security companies have released version 2010 for their security tool .

Here are the best security tools you can choose next year.

BitDefender Total Security 2010

BitDefender Total Security 2010 confirms its position as one of the leading security tools with many advanced technologies, especially the optimal technology for the system. BitDefender Total Security 2010's ability to detect malware is high, as well as the ability to block spam, enhance parental control (Parental Control) and especially the ability to protect privacy. compared with most other security software.

However, the downside of BitDefender Total Security 2010 is the ability to take up large memory, but it is a problem no longer worrying compared to most of today's powerful computer systems.

BitDefender Total Security 2010 is the best choice

+ Reference price: 79.95 USD with key used for 3 machines (direct purchase).

+ Assessment score: 4/5.

eScan Internet Security Suite 10

A very useful software for cleaning up the system being poisoned. The software is capable of detecting and cleaning up malware immediately on the computer as well as preventing their ability to function. It will actively scan all valid programs, which makes the system slower. Not only that, anti-spam capability as well as computer control features provided by the software are quite "poor".

+ Reference price: 49.95 USD, buy directly

+ Rating score: 2/5

K7 TotalSecurity Version 10.0

K7 TotalSecurity Version 10.0 is a rather strange name but it is the product of a big security company in Asia which is commonly used in Japan. This software also has the ability to filter spam quite well with the amount of memory occupied is considered temporary.

However, they need to improve their ability to clean up malware as well as the firewall they provide is easily broken. Maybe the next version of this software will do better.

+ Reference price: USD 49.95 for 3 machines, directly purchased

+ Assessment score: 2.5 / 5

Kaspersky Internet Security 2010

A security software which is trusted by many people today. KIS 10 provides users with everything expected of a security software and much more.

A smart firewall, Safe Run allows you to run an application in safe mode to protect the system. However, KIS 10's anti-spam and anti-malware capabilities are not good, not to mention "occupying" relatively large system resources when operating.

+ Reference price: 79.95 USD for 3 machines, buy directly

+ Assessment score: 3.5 / 5

Norton Internet Security 2010 (Beta)

Although only a beta version is available for free, Norton Internet Security 2010 gives users anti-malware tools a very fast and effective operation. It also allows hiding sensitive information and especially the anti-spam and child control features for parents that have been significantly improved compared to the previous version.

Panda Internet Security 2010

Panda Internet Security 2010 is a tool that is less likely to use system resources than previous versions but is more effective at blocking phishing sites (anti-phishing) as well as removing parts Malicious. However, the problem of Panda IS 2010 is that it will work very poorly when the system has "missed" the malicious code. If installing Panda Internet Security 2010 on a previous "clean" system will be a good choice.

+ Reference price: 79.95 USD for 3 machines, buy directly

+ Assessment score: 3/5.
