

The dawn of Artificial Intelligence has arrived, mankind is watching!

The most brilliant scientist in human history - Stephen Hawking once said: The development of a complete artificial intelligence (Artificial intelligence - AI) means spelling out the last words of humanity.

The most brilliant scientist in human history - Stephen Hawking once said: "Developing a complete artificial intelligence (AI) means spelling out the last words of humanity. "

Elon Musk - founder of Space X, Tesla Motor and Paypal also expressed concern that AI will become the biggest danger to mankind or Bill Gates, the richest man in the world also expressed one thing. Similar worries. So is it time for us to worry about AI?

Ironically, what other VIPs worry about is what humanity has been and will develop its power to new heights. It would be a blatant deception if big tech corporations say they don't care or try to stay away from what's called this AI. The power of AI can help them in many things, from database management to analyzing, evaluating and making predictions. With the ability to manage the top supercomputers to " help ", AI is too great for people to abandon it. But if so, what to do with that worry?

What was the AI ??born for?

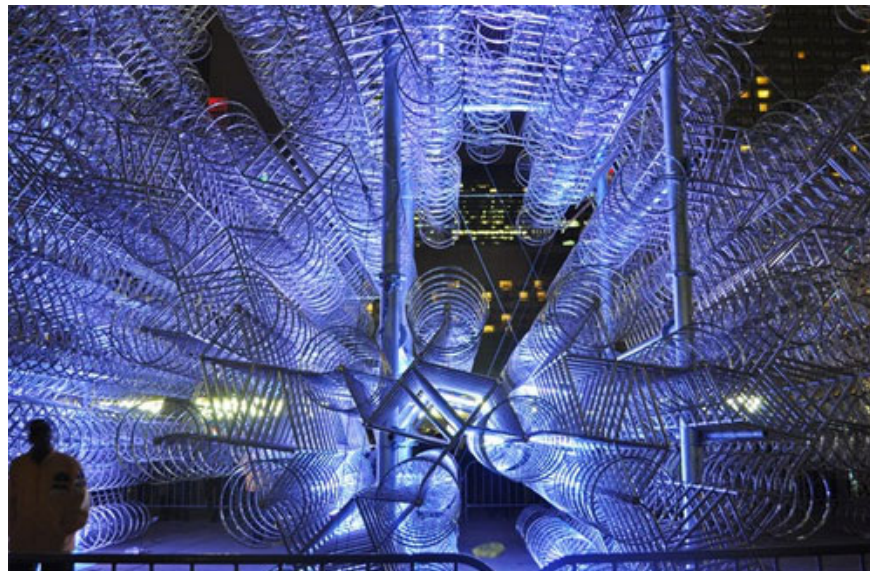

Before we talk about the dangers of AI, we need to know the reason they are born. Computers are one of the greatest inventions of mankind, and their power is the key for us to open new, more sophisticated, more sophisticated doors of science. The increase in hardware and computer manufacturing technologies has helped us to achieve great achievements and progress, which AI can consider as the key for people to make the best use of the power of those. Super computer.

Basically, AI is " *taught* " in the way that our neurons must receive and process large amounts of data daily. By continuously identifying and remembering commands, content, processing, . at the request of people, AI is also " *learned* " and " *smart* " over time. This makes it possible to adapt itself to the massive database system of supercomputers and easily meet the needs of human data retrieval, even though they are sometimes not quite the same. .

So basically, AI is born to help us.

Is the power of AI enough for us to fear?

When it comes to AI and its power, many people will be worried about a scenario like in sci-fi films when AI will become a " *big picture* " for people. Indeed, the controversy surrounding continuing to upgrade " *wisdom* " for AI as well as being alert or even avoiding it is a topic that has never ended. But look at the fact, we will more or less have our own answers.

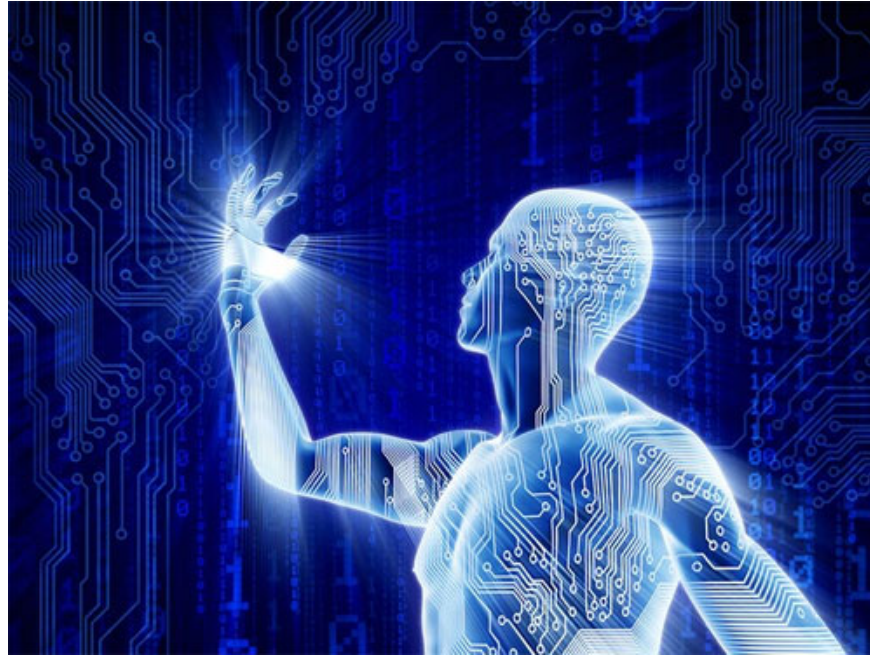

With its ability, AI is helping people do things that we can't, or it's hard to do well on our own. The help of an artificial intelligence is helping doctors have a great tool to detect the most dangerous pathogens, speech recognition algorithms are a tool to support these operations. smart devices, or even help illiterate people have the opportunity to come into contact with culture, . No matter what, it is clear that wisdom-wisdom is something that can help them I am very much in life.

AI itself is man-made, so it is different from many people's thoughts, whether it is dangerous or not. Say no, AI is like a child: you teach him the right way, he will be a good person, you teach him the wrong, it will be a danger of society. Before AI is smart enough to realize what is right is wrong, the way we are using AI will determine its impact on society. Don't assume that this is a staggering worry, because if you know the ability of AI to intervene deeply in your life, from psychological evaluations to controlling daily activities (*through devices*) *electronic*), you will know Stephen Hawking's worries are completely grounded.

Please use AI properly

Imagine AI as a latest, expensive and powerful car, but it only shows its value when it comes to a true driver. The same good car you can use as a great transport vehicle, can also be used as a tool to " *break the hamlet* ". While the prospect of AI smart enough to threaten human life only appears on a television screen, its applications are visible. There are so many things that we humans cannot do on our own hands, but AI and its abilities are possible.

And if you're not really reassured, this is good news for you: governments as well as scientists have been and still have complete control over what AI can do. Just as a society needs to maintain stability by law, the creation and use of AI has been in strict management processes. Mankind has enough intelligence to create them, and also has enough intelligence to know how to control their power. Unlike in the famous movie " *I, Robot* " with the participation of actor Will Smith, disabling the AI is still at the fingertips of managers. Every day AI is used to support people, we can still be assured of them that day.

So, don't be surprised if one day is not far away, artificial intelligence will become an indispensable part of your life.
