

The first interesting information about iOS 18

Although Apple's iOS 17 has not yet been released, information about iOS 18 has appeared.

According to The Information, Apple seems to plan to use language models to make Siri in iOS 18 smarter, do more things.

For example, Siri will be able to continuously take 5 photos, turn them into gifs and send it to friends. Currently, converting images to GIF format can be done using the Shortcuts app but requires users to do it manually.

?Siri? will have similar functionality to the Shortcuts app. The Shortcuts app has become an important part of the iPhone's operating system and can perform a number of high-demand automation tasks from removing photo backgrounds to creating to-do lists.

The Information also shared that Apple hopes to announce a new version of Siri with a series of new features next year. Therefore, it is likely that iOS 18 will be the operating system that has the new version of Siri.

Google, Apple's rival, is also using language modeling software to upgrade Google Assistant to help this virtual assistant handle more complex tasks. So Apple wants to release a new version of Siri at the same time to compete with Google.

For a long time, Apple's virtual assistant Siri has received many criticisms because it is far inferior to virtual assistants from other companies such as Google and Alexa. The reason is that Apple focuses on security and privacy.

Let's wait and see what new features Apple will add in the upcoming iOS 18 update.
