

The future of computers and the Internet

Since it was invented so far, from a bulky machine weighing tens of tons and only performing a few simple calculations, computers now fit in the palm of a hand that can do a lot of work. different.

Since it was invented so far, from a bulky machine weighing tens of tons and only performing a few simple calculations, computers now fit in the palm of a hand that can do a lot of work. different. According to experts in the field of information technology, computers and the Internet will have great growth in the near future. Here are some forecasts:

Computer

Future computers will consist of only 23 parts. Fixed computers are intended for storing data of a bank branch, for example, semi-fixed computers for home or office use and handheld computers for individuals. This type of handheld computer can be linked to two other computer systems.

Computers will be smart machines everywhere, they will do all the work to replace people. People will control them with words or by touching them. All computers will have the voice recognition function and have all the necessary connection ports, all information will be searched by computer, people just sit there to receive information from them.

Computers will be located anywhere in the house, they have different shapes or sizes and do not look like a normal computer today. They could be a mobile phone, a toaster, sunglasses, gloves . The integration of control devices and information management will be an important job for the manufacturing industry. computer. People

will connect to the Internet. All activities will be done by computers such as shopping, controlling robots to build houses, controlling cooking robots .

Internet

On the Internet there will no longer exist any private and private networks that will grow widely, people can freely go online and have no management in use.

The Internet will change the traditional ways of communication, people can connect to the Internet via television, phone, player and all computers. Traditional newspapers and letters will gradually be forgotten. The form of data storage on computers will also be lost and instead are the forms of online data storage.

People can communicate and talk to each other as if they were meeting each other in real life. People can set up a communication channel with others like broadcasting channels.

Internet usage will be free, but other added values ??will have to be paid, like watching pay TV like today.

Advertising on the Internet will take place like on television, and take place anytime, anywhere.

Information stored online will be accessed for free, but storing information will have to be paid.

Cable TV companies will link to phone companies to create a TV / phone form. It will give users the form of entertainment, communication via TV receiver. This receiver will be linked to banks, when users use the service of calling or watching movies . the bank will deduct money into their credit card account.
