

The handler for hackers attacking the corporate network is the company's employees

The habit of using the Internet at work to surf the web, do personal things like receiving and sending sensitive information or not privacy to social network accounts is the leading cause of data security issues. The company's coming with external threats.

The habit of using the Internet at work to surf the web, do personal things like receiving and sending sensitive information or not privacy to social network accounts is the leading cause of data security issues. The company's coming with external threats. This issue was even dubbed Cyberloafing.

Currently, employees in many companies and organizations are allowed to access social networks as well as send personal emails from internet-connected internal computers. But the results of a study show that using the personal browser too often on the company's computers and networks is a serious problem affecting network security and information security. Especially the situation is even more serious when employees update their own website information, watching porn videos or pictures for a long time.

45% of the respondents in the study admitted that they often use computers in the company to work privately. On average, each employee wasted 2.09 hours a day at the company to work privately on the Internet. This directly affects work performance.

Research results also show that employees who regularly work on their own Internet have little knowledge of information security. They often assume that their actions do not affect the network security system of the company and are willing to ignore the risk warnings and ignore safety information on the Internet. These employees are real internet addicts, and are the source of the greatest threat to the information security of companies and organizations today.

Internet addicts are always eager to go online to surf the face, play online games, shop . And to achieve their goals, they ignore safety standards, ignore advice on security Confidential information, only engrossed in their own virtual world.

How should companies prevent employees from abusing computers and the internet at work on their own?

Cutting all internet access of employees in the company is impossible. Because the Internet has become an important part of operations as well as the vital decisions of companies.

The reminder of information security issues does not achieve high efficiency. Because people who go online often have confidence in their knowledge, they often overlook those reminders.

Companies and organizations may apply some sanctions for serious violations of the abuse of computers and corporate networks on their own. And the most effective and sustainable method offered by experts is that companies should train employees to identify different aspects of the Internet, creating groups so they can exchange questions and questions. problems arising when using the Internet.
