

The id attribute in HTML

In HTML, the `id` attribute is used to specify a unique id for an HTML element (the value must be unique in the HTML file).

In HTML, the `id` attribute is used to specify a unique id for an HTML element (the value must be unique in the HTML file). The `id` value can be used in CSS or JavaScript to perform a certain task for a single element with that id value.

In CSS, to select an element with an id, use the character character (`#`) before the element `id` .

Example using CSS to style the element with `id` 'title'

This is the title

Note:

1. The `id` attribute can be used with any HTML element.
2. The `id` value is case sensitive.
3. The `id` value must contain at least 1 character and no spaces.

Distinguish class and id in HTML

The HTML element can have only one `id` belonging to that element, while the `class` can be used for multiple elements.

My city

Hanoi

Hanoi is the capital of Vietnam.

Paris

Paris is the capital of France.

Tokyo

Tokyo is the capital of Japan.

Compare the difference between class and id attributes in HTML

Use id attribute in JavaScript

JavaScript can access elements with a certain class name using `getElementById()`

Bookmark the page with ID and Link

Bookmarking in HTML allows readers to go to different parts of the page faster, very useful if the page is too long. To create a bookmark, first create a bookmark, then add the path to it. When clicking on the link, the page will scroll to the highlighted location.

First create a bookmark with the `id` attribute

Chapter 4

Then add the path to this bookmark ('Go to Chapter 4), from the same page.

```
?i t?i Ch??ng 4
```

Or add a link to this bookmark from another page.

```
?i t?i Ch??ng 4
```
