

# The keyboard responds slowly when playing games and 5 effective ways to fix it

Do you feel the keyboard responds slowly when playing games on Win 10 and Win 11? TipsMake will give detailed instructions on how to fix this problem!

Playing games on computers always gives gamers a great experience. But sometimes problems related to the keyboard or some minor problems will also affect your gaming. Among them, slow keyboard response when playing games is a common situation that many players encounter. So, TipsMake today will show you how to fix this problem so you can play the game more smoothly.

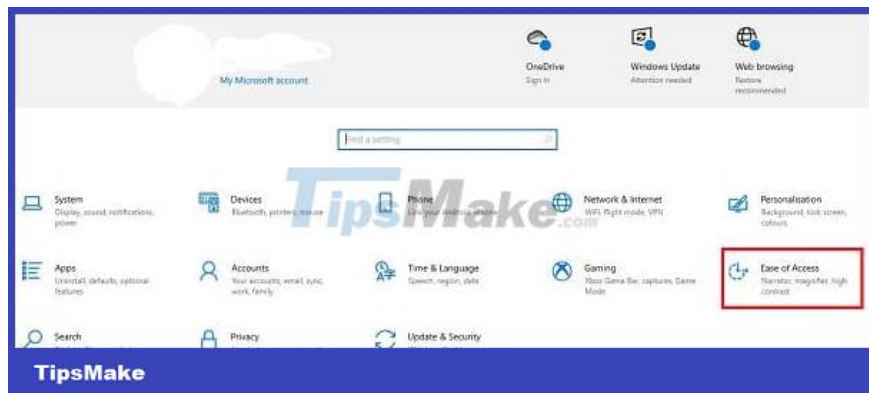

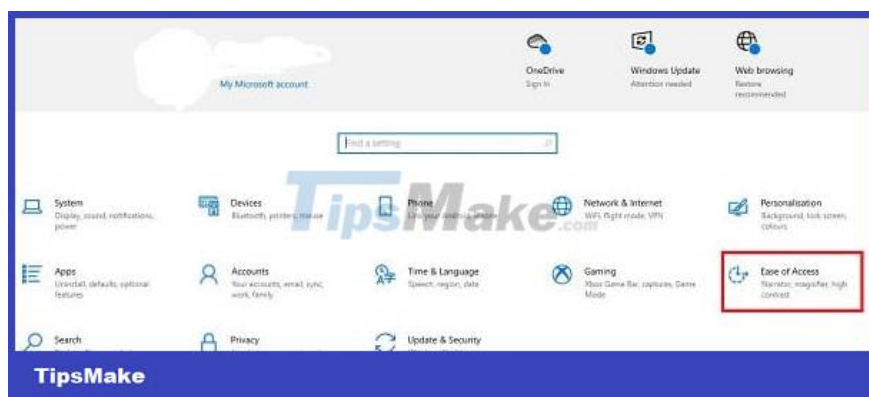

# Tips to fix slow keyboard response error when playing games on Windows 10 and Windows 11

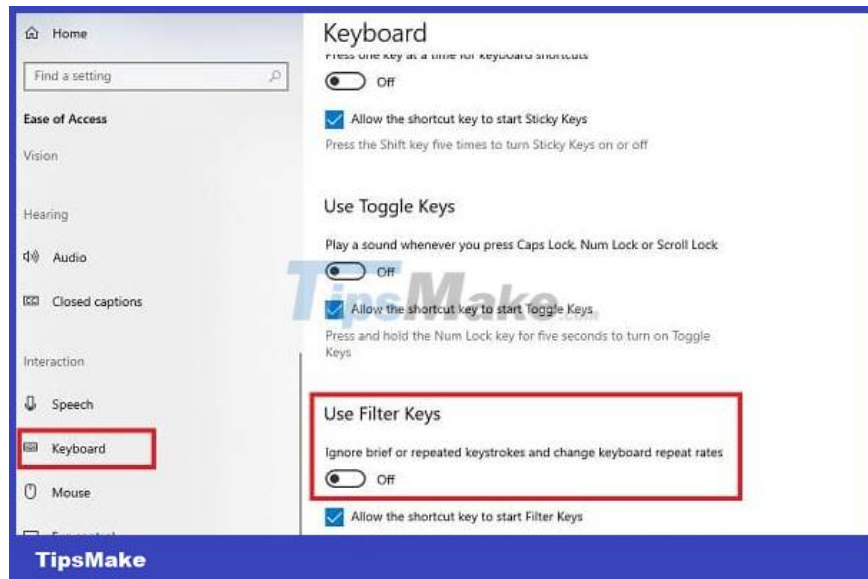

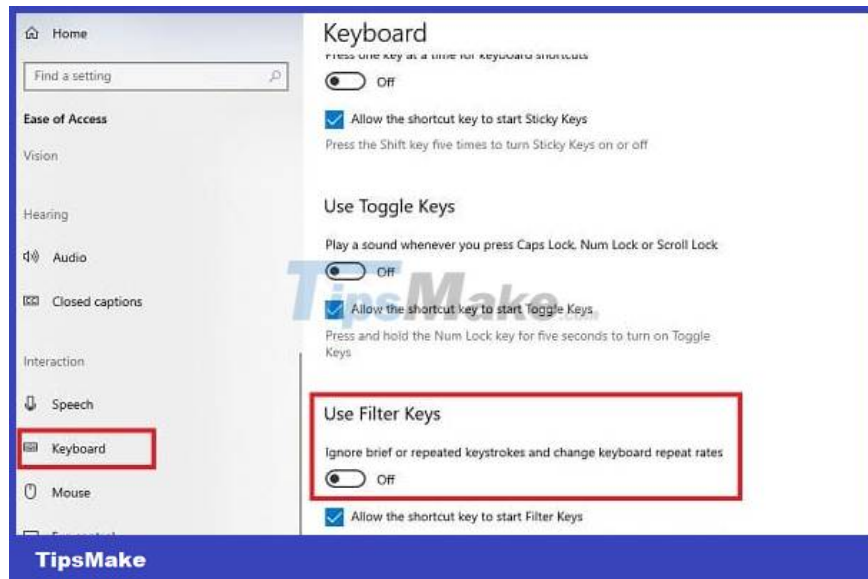

Keyboard latency will certainly greatly affect gamers, especially games that require a lot of keyboard operations. Even because the keyboard responds slowly, the game's results also change. So, please apply the computer tips below to fix it.

## Method 1: Disable Filter Keys

Turning off the filter key is a trick you need to do because this can be the cause of the problem of slow keyboard response. Because Filter Keys is a feature that instructs Windows to ignore short or repeated keystrokes. Therefore, to turn off the filter from the keyboard settings, users should click on the Start icon > Click on the gear-shaped Settings icon to go to Settings > Continue to click on Ease of Access.

Scroll down and click Keyboard in the left menu > Find Use Filter Keys in the right pane and click the toggle button to switch to Off.

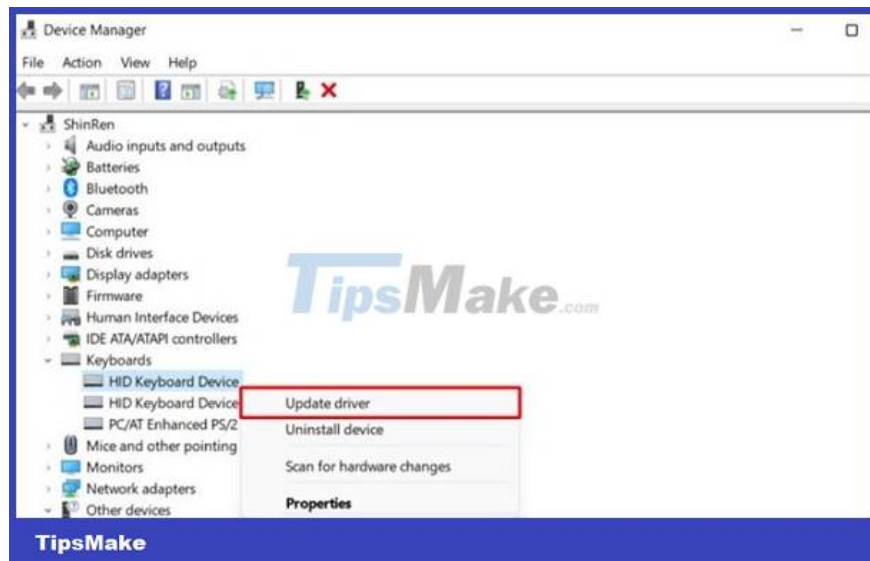

For Windows 11, users follow these steps: Settings > Accessibility > Keyboard > Press the switch to switch to Off in the Filter Keys section.

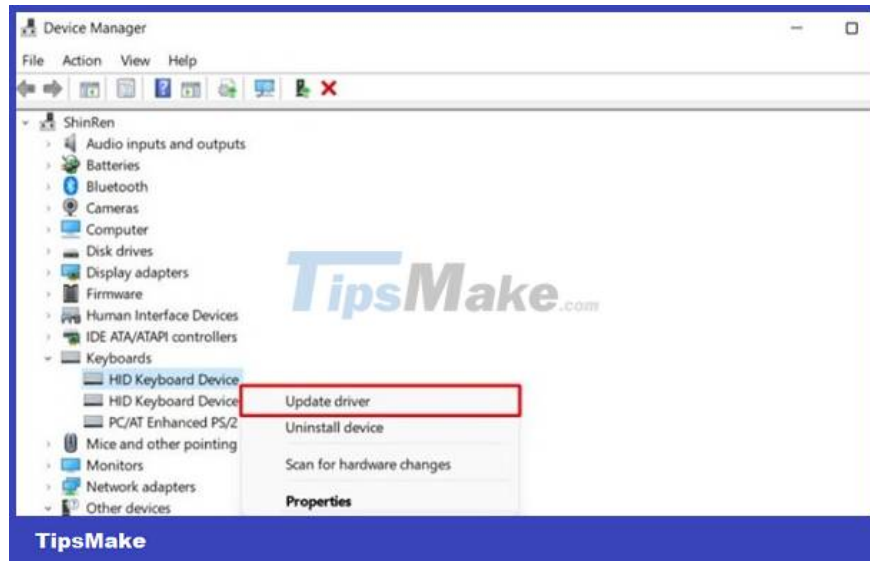

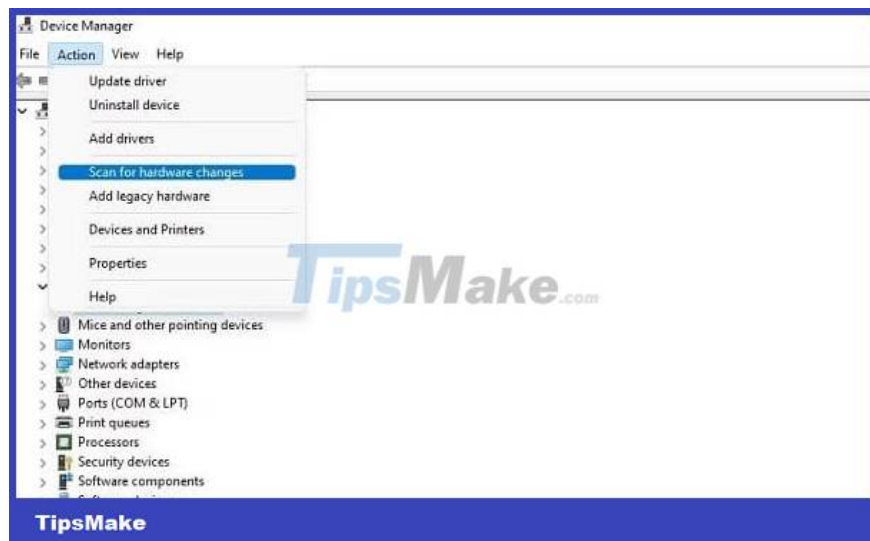

## Method 2: Update or Reinstall Computer Keyboard Driver

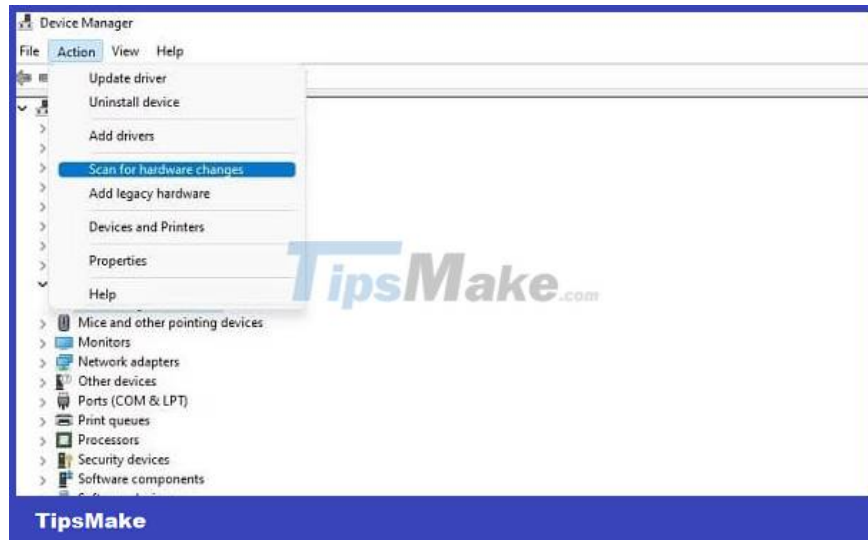

1. Step 1: Please press the key combination Windows + R > Type devmgmt.msc > Press Enter or OK.
2. Step 2: Find the Keyboards line, double-click on it to expand this section > When the sub-section opens, right-click on your keyboard and select Update driver to update.

In case the driver is damaged or incompatible, it causes keyboard delay or the above method is ineffective. You can take measures to reinstall the keyboard driver. First, right-click on your keyboard in Step 2 > Select Uninstall device > Confirm uninstallation > Click on the Action tab in the top menu bar > Select Scan for hardware changes. Besides, you can also restart your PC and the missing driver will automatically be reinstalled.

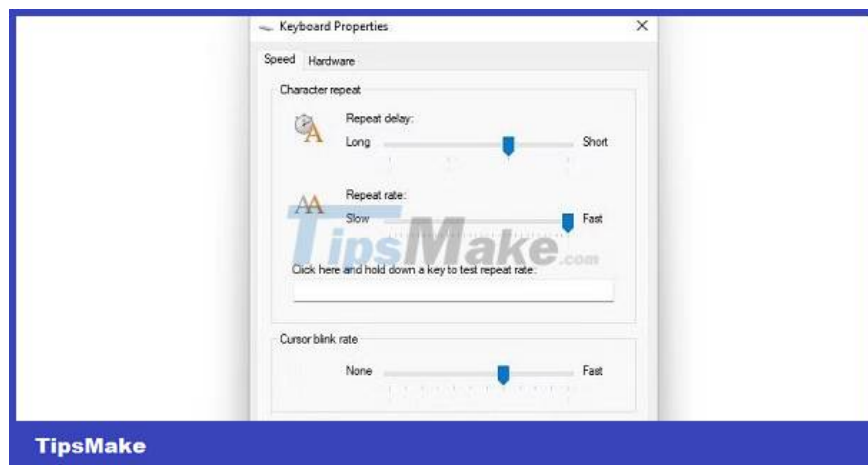

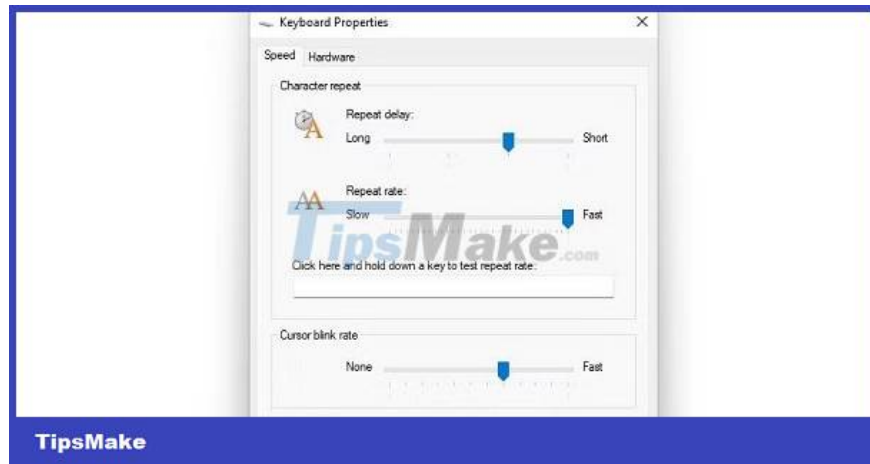

### Method 3: Change keyboard properties

This is also an effective solution for gamers to fix the problem of slow keyboard response. You just need to press the key combination Windows + R > Enter into the control keyboard box > Then press Enter or Click OK.

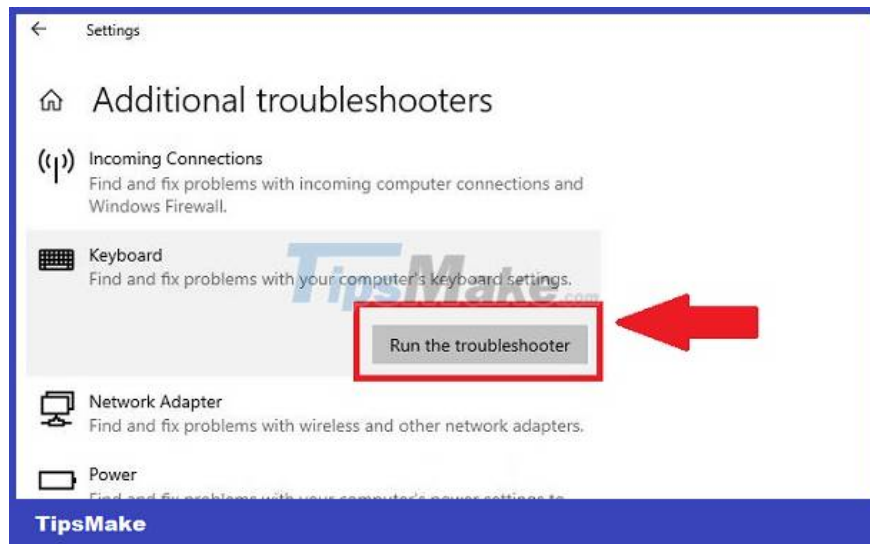

When the keyboard properties window appears, you will see two items: Repeat delay and Repeat rate. Please shorten the Repeat delay and increase the Repeat rate so that the keyboard responds faster (you can adjust these two items according to your needs).

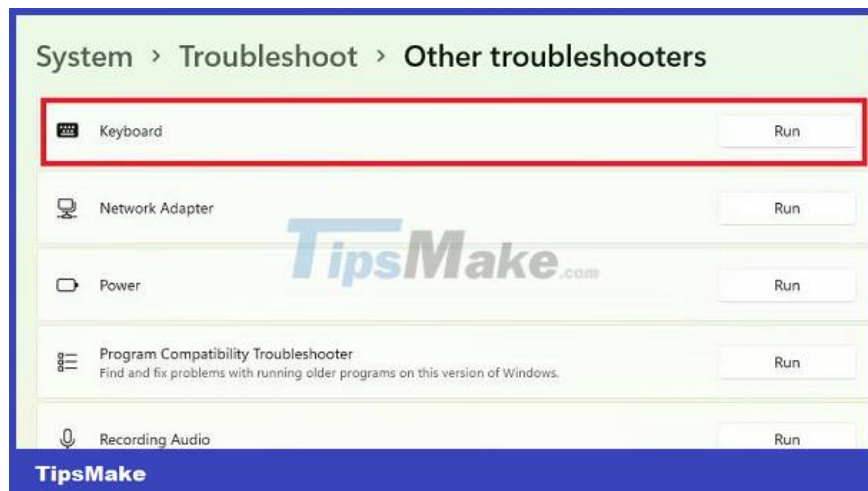

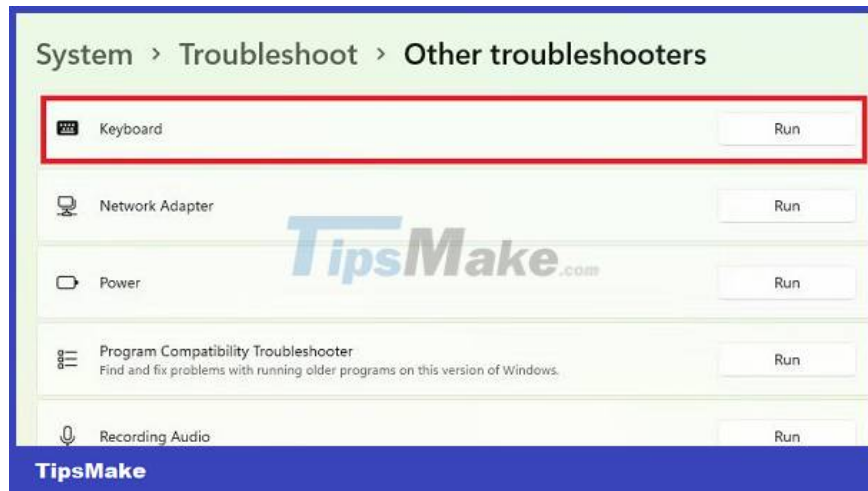

## Method 4: Use the keyboard troubleshooter

Click Start and open Settings like the instructions I shared in method 1. Then, you navigate to Update & Security > Troubleshoot. The user will now see suggested troubleshooter items. If you don't see the Keyboard section, click Additional troubleshooters. Find Keyboard > Then click Run the troubleshooter.

If you use Windows 11, navigate to this path: Settings > System > Troubleshoot > Other Troubleshooter > Then you will see the Keyboard section and click Run.

## Method 5: Some ways to solve keyboard lag when playing games

Many people who play games like Roblox, CS:GO, Minecraft, Fortnite and Valorant say that the keyboard does not respond immediately when they operate. With classic games like this, the problem of slow keyboard response causing discomfort is not simple. If applying the above methods still cannot fix it, please try:

1. Close unused applications so your PC can focus its resources solely on the game you're playing.
2. Players should turn off unnecessary background applications to reduce computer memory usage. This also speeds up the data entry process.
3. If you use a separate keyboard, you should check the connections to see if they are secure or not. Or maybe this keyboard is damaged or has some problem, gamers should try changing to another keyboard to check.

TipsMake has finished sharing how to fix the keyboard responding slowly when playing games. Wishing gamers success in fixing errors and having great experiences with their games.
