

The most bizarre creatures are found by scientists under the sea floor of Australia

Researchers at the Victory Museum call the species a small mouth, its body resembles a jellyfish, but there is no such presence as the Peanut Worm.

The ocean is vast and contains countless mysteries that people cannot discover. That's why researchers at the Victory Museum decided to head to the coast of Australia to find new marine creatures.

1. 10 legendary creatures can be real
2. The strange creature re-grows its head, turning its prey into water
3. Close-up of fish walking on the seabed surprised many people

After a month on the ship Marine National Facility at sea, researchers found many new "monsters" of the sea . and proceeded to name them.

They call the creature a small mouth, its body is like jellyfish, but it is not present as "Peanut Worm". Although the appearance is quite similar to that of a worm, but based on their habitat, when in danger of this creature often curling up like peanuts, the researchers decided to take the odd name for them. .

This very long hindquarters are named Shortarse Feelerfish. Their shape looks like a comb.

This fish is called Grideye Spiderfish. They have a rather strange and scary shape, looking like they are "leaving the neck", but the actual white part is a light detector, instead of the eye. Even in some cases, this "machine" secretes substances to attract prey.

This is a new starfish species, researchers have yet to come up with a name that suits them. But this starfish is suspected of being a "spawn" between starfish and octopus.

The strange creature with this scary smile is called the lizard fish by scientists.
