

The mystery of the existence of the soul from a scientific perspective

The soul is the existential part of the human being after the death of many people. But so far, people have not been able to determine whether or not there is a soul. If it really exists, what form is it, invisible or tangible?

The soul is the existential part of the human being after the death of many people. But so far, people have not been able to determine whether or not there is a soul. If it really exists, what form is it, invisible or tangible? Scientists have been in search of convincing evidence of the existence of this ghost.

The mystery of the negative realm, near-death experience, communication with the soul of a dead person is always a human obsession. Since ancient times, survivors have always wanted to explore the human world after death.

Science and reasoning about the soul

For those who believe in the afterlife, all the unusual, unexplained phenomena are related to ghosts, from the door itself, mysteriously disappearing objects, unusually cold regions in the act. Lang until seeing the dead relatives.

But with science, evidence of ghost existence is a more complex issue. Even so, until now, the scientific world has not given a unified definition of "ghost". Some opinions suggest that ghosts are extrasensory phenomena that are brought into the world by the human brain, others think that ghosts are the souls of the dead who stray on the way to the afterlife.

According to reports of ghost cases, we can see that ghosts are able to penetrate solid objects, and can also close and move objects in the room. But the fact that both of these cases coexist is contrary to logical reasoning and fundamental laws of physics. Therefore only one of the two cases is allowed to exist.

In addition, if ghosts are only human souls, why exist ghost and ghost cars. Or why ghosts "appear" in human form with costumes and other items like hats and sticks .?

There is one more problem of ghost controversy related to murder cases. If ghosts are the souls of the dead, why do not the souls of the victims communicate with humans to expose the killer.

Those who believe in the existence of the supernatural world and use diverse tools to find souls called ghost hunters. They use technology devices such as Geiger counters, ion detectors, infrared cameras, magnetic field detectors (EMF) and ultra-sensitive microphones to perform scientific searches. But, there is still no convincing evidence of ghosts being found.

Many people believe that we have not proven the existence of ghosts because there is no suitable technology. This idea was immediately opposed by many people, because if ghosts really existed in the material world and could be recorded with photos, movies or audio recordings, the existence of ghosts would definitely be proved one. convincing, but so far this has not been realized. Conversely, if ghosts exist but cannot be detected and recorded scientifically, photographs, videos or audio recordings that are believed to be evidence of ghosts have become false.

The hypotheses about ghosts are unconvincing and almost no scientific content so no one has been able to confirm whether ghosts exist or not. In addition, the development of technology allows people to create and share horror images themselves. Therefore, the study of the soul becomes more and more difficult.

Why do people believe in spirits and demons?

According to scientists, people believe in the existence of souls, demons due to beliefs in the afterlife, believing in life after death in different cultures. When members of a family believe in the soul, the majority of growing up children have strong faith in it.

Einstein's "energy conservation law" says that energy is not generated or lost but is transformed from one form to another, or transmitted from one object to another. Many people believe in demons who have a scientific understanding of using this theory and believe that, once a person dies, the body's energy will enter the environment in the form of heat, and the body transforms into energy. In the predator or microorganism body. In the process of decomposition, a substance called phosphorus will escape from the body and rise up to meet a burning atmosphere or dangian called "ghost play". This is the reason why ghost hunting tools cannot detect human energy after death.

According to folklore scholar Bill Ellis, ghost hunters often invest a lot of effort and money searching for souls and demons to examine and redefine the boundaries of scientific understanding and to align their beliefs. that right.

In summary, although there are many images, sounds and videos, evidence of souls in the modern world but still cannot be sure that ghosts exist or not. Perhaps to prove, we still have to wait for more scientific participation with in-depth research and special equipment.
