

The specs show that the Samsung Galaxy S9 and S9 Plus duo are lower than the older iPhones

The results of the test of the S9 duo specifications prevent many from surprises, they are in a lower position than competitors like the iPhone and even lower than the old devices.

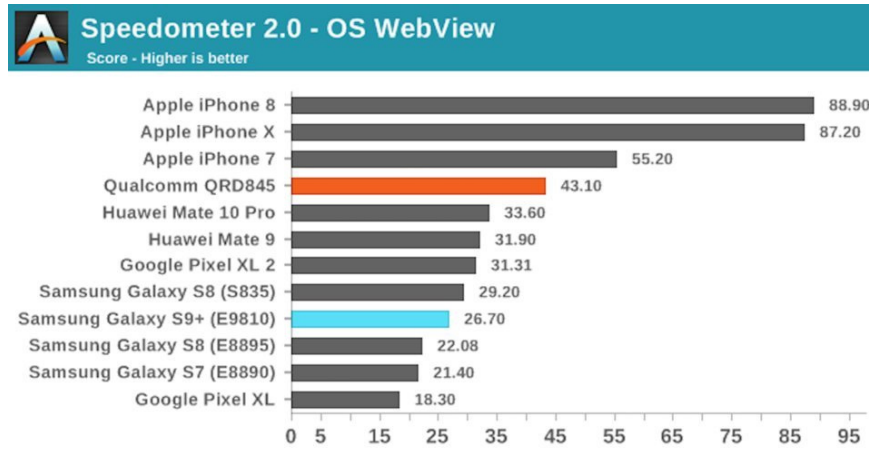

The AnandTech website with a Speedometer 2.0 application that runs a test of technology devices to evaluate chip performance on systems (SoC) has tested the chip's performance on a number of phones and has made new discoveries. most about parameters of Galaxy S9 and S9 Plus.

The results of the test of the S9 duo specifications prevent many from surprises, they are in a lower position than competitors like the iPhone and even lower than the old devices.

The new Galaxy S duo has two processor options for two different areas: Qualcomm Snapdragon 845 for the US market and Samsung Exynos 9810 with an eight core (octa core) structure for the international version.

According to Qualcomm, the Snapdragon 845 chip will help Android devices increase in popularity this year, which it did for Samsung's Galaxy S8 last year. But the results are not what the company promised, Exynos 9810 Galaxy S9 even has worse results than other devices.

The chart after the test showed that Galaxy S9 Plus even ranked 9th, not only behind iPhone X, iPhone 7, and 8 but also its old Galaxy S8 model.

Before this result, Samsung's spokesman said that the phones checked by AnandTech's experts were just "demo devices" of the software, exclusively for the introduction at MWC 2018 event. The upcoming release will meet the standards in the SoC test.
