

The ThinkPad X1 'lost points' because of its ability to resist water spills

The X1 will spill a certain amount of water into the keyboard and if it exceeds the number, it will automatically switch to self-protection and shutdown mode to ensure safety.

Lenovo's ultra-light, ultra-light laptop can't protect itself from water spills like its introduction.

>> Lenovo ThinkPad Laptop thin horizontal MacBook Air

The ThinkPad X1, the latest unique laptop Lenovo introduced, was unfortunate when it failed to pass the spill-proof keyboard test.

According to Lenovo's announcement, the X1 will overflow a certain amount of water poured into the keyboard and if the number exceeds the number, it will automatically turn on the self-protection and shutdown mode to ensure safety.

However, in Engadget's small test, with a small amount of water poured slowly, the X1 only "endured" for a few seconds and then turned itself off. Although the water has been drained out and dried, the X1 still cannot

restart.

Lenovo will likely have to review this technical error of X1 to fix it in time before starting selling in the market.

Below is the video of the overflow test on the ThinkPad X1:
