

The three most important archaeological findings of the century make human history rewrite

Pyramids on the Crimea, a 300,000-year-old nanostructures in the Ural mountains ... are some of the archaeological findings that disturb the world. These findings show that we do not fully understand the development process of humanity, and it is very likely that humans survive longer than what we already know.

Pyramids on the Crimea, a 300,000-year-old nanostructures in the Ural mountains . are some of the archaeological findings that disturb the world. These findings show that we do not fully understand the development process of humanity, and it is very likely that humans survive longer than what we already know.

3 archaeological findings that scientists consider to be the most important century make world history rewrite.

The pyramids in Bosnia

The pyramids were discovered in Bosnia near the town of Visoko, northwest Sarajevo, Bosnia (also known as the Bosnian pyramid valley) is considered the oldest pyramid built by humans.

Bosnia pyramid valley.

In this Bosnian **pyramid**, the **Sun pyramid** is higher than the entire **Giza pyramid in Egypt** .

But what surprised and unexplainable researchers until this day was that these two giant pyramids had four overlapping faces on the compass, why the two pyramids belong to two civilizations in apart from each other, there is no exchange but there are strange similarities?

The pyramids on the Crimea

Archaeologists were surprised to discover a pyramid on the Crimea is thought to have appeared since **the dinosaurs** ran freely on Earth.

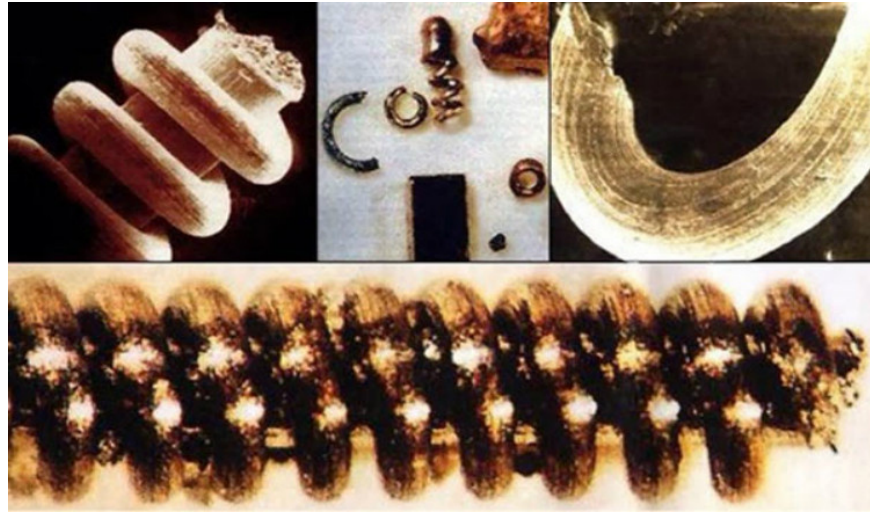

Ancient ruins on Crimea.

In the Crimea, archaeologists have found many treasures of different civilizations from Rome, Greece to Ottoman, Genoa and Turkey. The existing buildings and pyramids here have made researchers change the way they view history.

Stone works, towers in this area were first discovered in 1999 by **Vitalij Gokh** , a veteran of the Soviet army. Later, Gokh became a pyramid researcher. He claimed that the pyramids and stone structures were buried on the Crimea.

300,000-year-old nanostructures in the Ural mountains

In 1991, extremely small coil objects were discovered in Russia by geologists searching for gold in the Ural mountains. They have coiled, spiral, and axial structures and cannot identify their components. This may be a nano structure. Surprisingly, archaeologists discovered that they date from 300,000 years ago. If this is true, then it means that on the earth there existed an advanced technologically advanced **civilization** capable of creating **nanotechnology** 300,000 years ago.

The Russian Academy of Sciences conducted experiments to test these objects. The results are very interesting and unexpected. Large objects obtained are composed mainly of copper, smaller objects are made of tungsten and molybdenum.
