

The tiny 'laptop', which is just the size of a finger, can play a delicious game

And no, of course he can't play Crysis, or even a Pokemon puzzle, but can play some classic games built in.

ThinkPad laptops have existed for a long time and have a firm foothold in the market. It can be said that this is one of the rare models with impressive designs that customers can see right away. The highlight on the design of the ThinkPad is the toughness and especially the characteristic red TrackPoint knob. Recently, a hard fan of ThinkPad created a tiny version of this laptop.

ThinkTiny - A miniature laptop

What is special is that the tiny version is not just a model, but it can work, just the power and ability are 'tiny' as the size of the machine only. Klinger used a 3D printer to create the frame, then attached a 128 x 64 pixel OLED screen to the board with a circuit board and simple code to create the ultra-tiny ThinkPad, which was called ThinkTiny, unfortunately. It can't play Crysis or Pokemon puzzle, but it can play some classic games like Snake, Tetris and Lunar Lander.
