

The unexpected truth about Uranus - the king of the sky

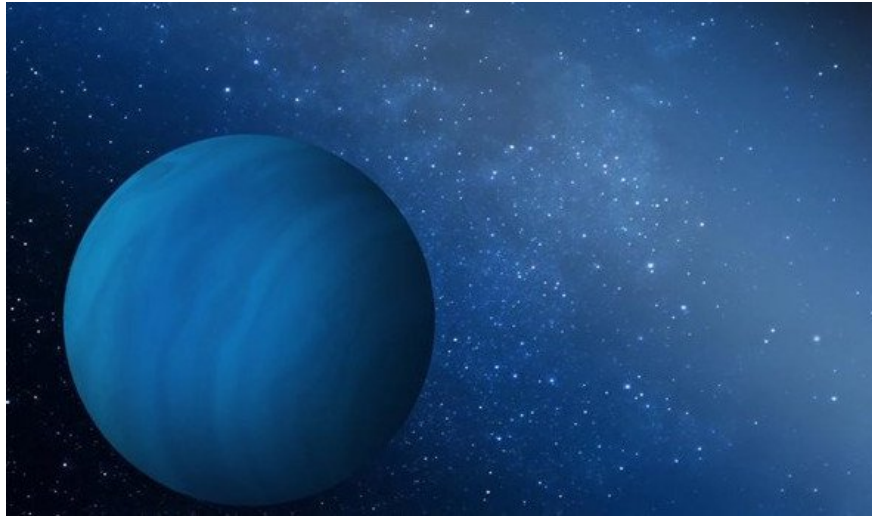

Uranus or Uranus is the seventh planet in the solar system. This planet is named after the sky god of the ancient Greeks Uranus.

Uranus or Uranus is the seventh planet in the solar system. Uranus is mentioned by few people but it has strange and interesting features that no planet in the solar system has.

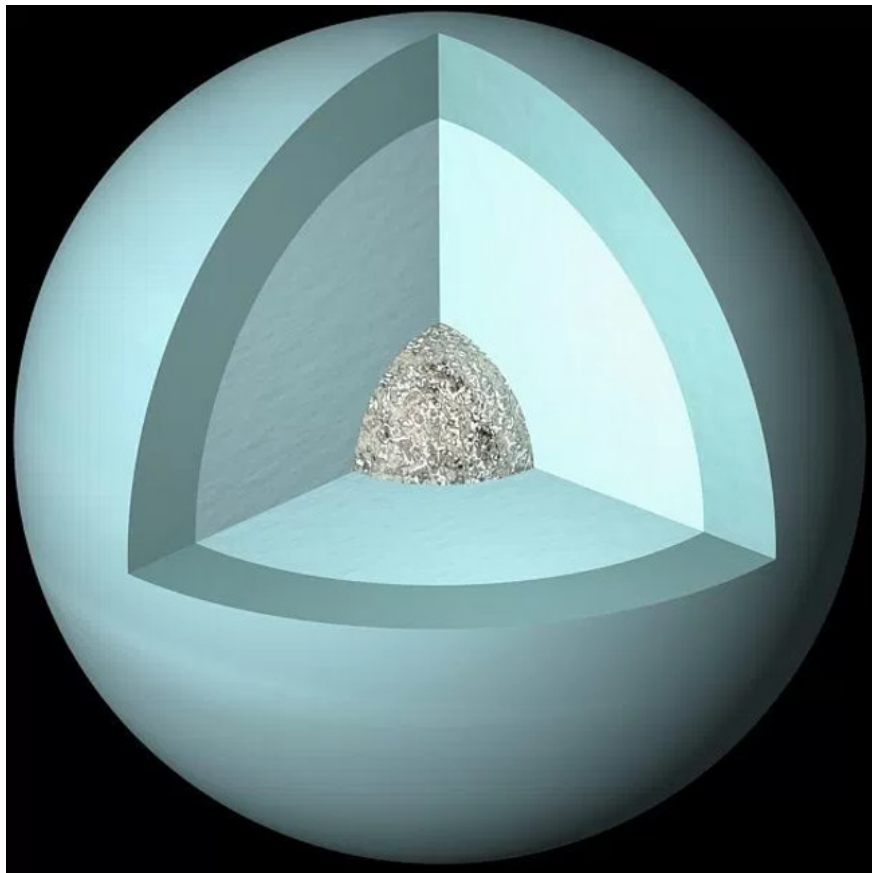

1. How big is the solar system?
2. Did you know: Mars, Venus has rotten egg smell and the Moon smells of gunpowder

This planet is named after the sky god of the ancient Greeks Uranus. This is the only planet in the solar system named after a god in Greek mythology instead of Roman mythology.

The minimum temperature on Uranus is -224°C , making it the planet with the coldest atmosphere in the solar system.

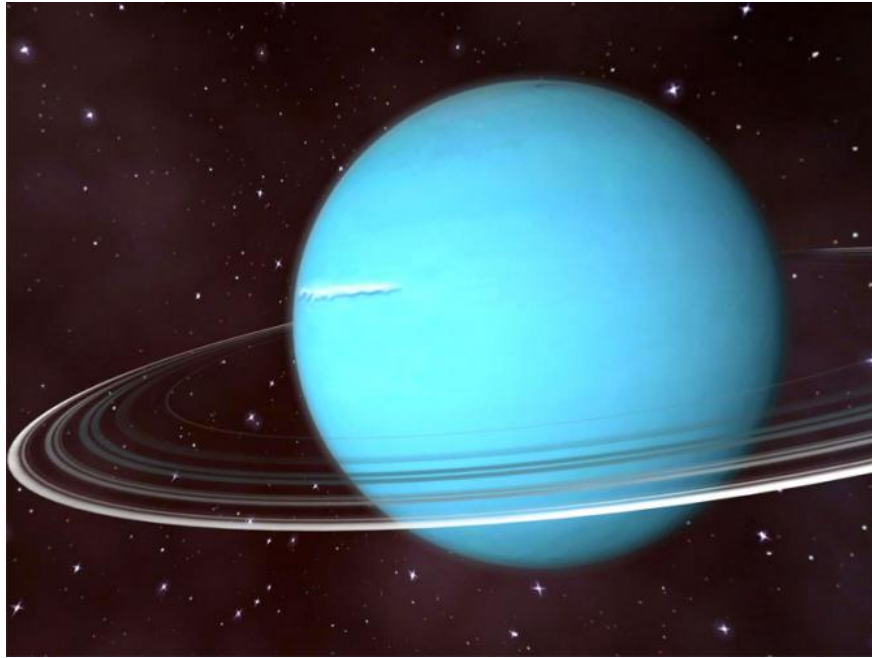

The structure inside Uranus contains only one ice core and ice.

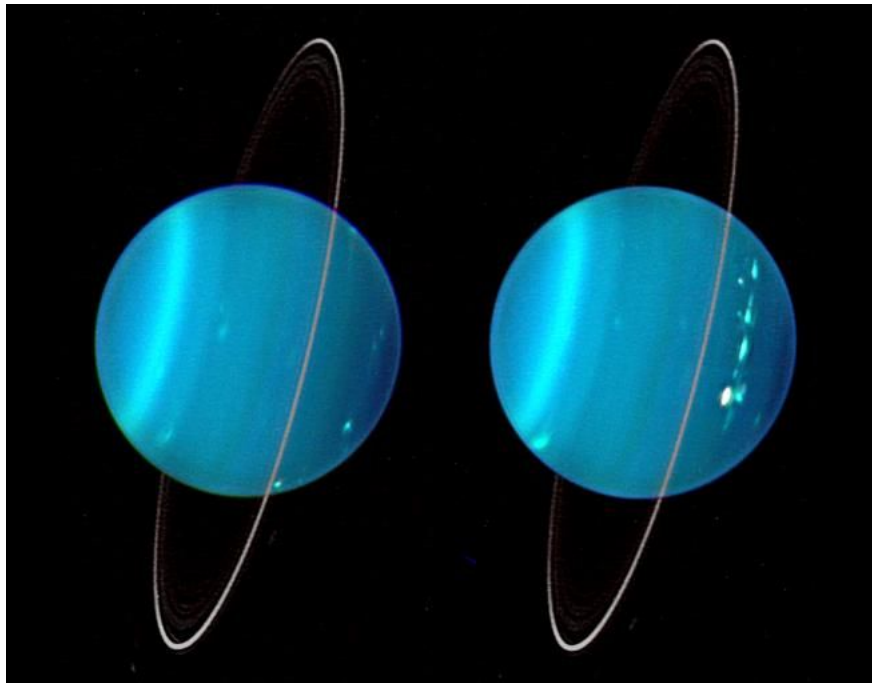

In the solar system, Uranus is ranked 3rd in size and 4 in volume. Uranus can contain 63 Earths within it.

On the Star of Heaven, there are only two seasons: summer and winter. Summer in Heavenly Star lasts 42 years.

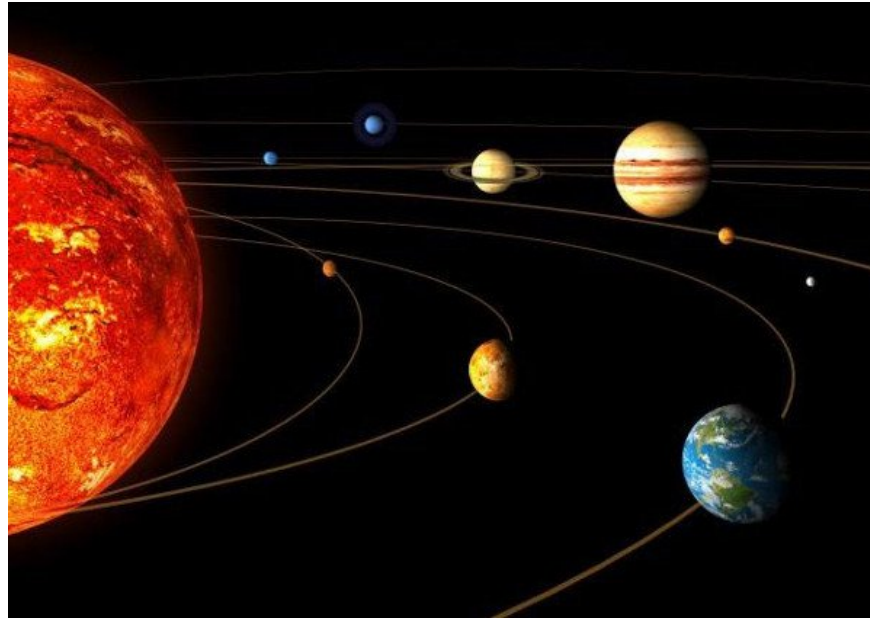

Uranus has 27 moons and they are named after the characters in the works of Shakespeare and Alexander Pope.

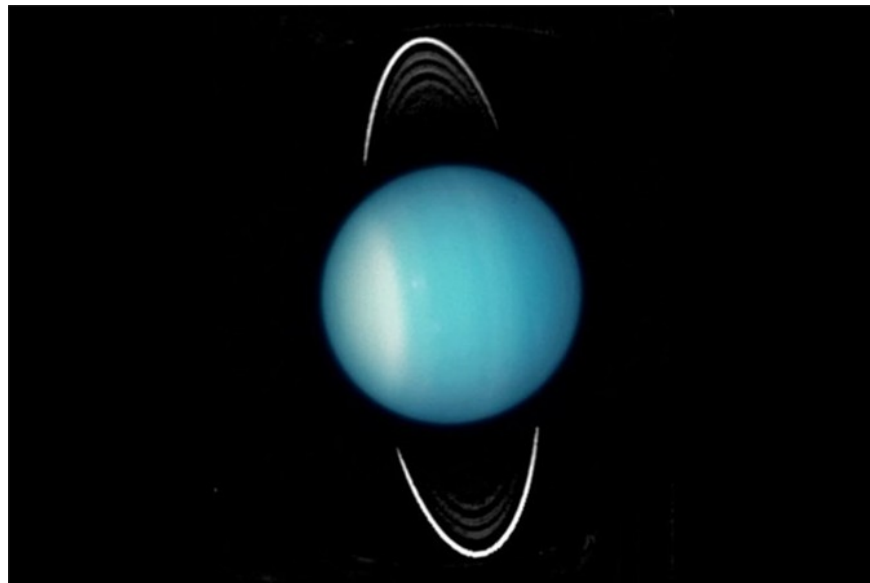

The wind speed on celestial star can reach 900km / h.

The axis of rotation of Uranus is tilted 98 degrees, while the Earth's axis is tilted at an angle of 23.5 degrees. That is, the planet rotates when it is close to parallel in the orbital plane around its Sun, its north and south poles are almost at equatorial positions compared to other planets, so they receive a lot of Face light energy. Heaven is more than the equator.

Uranus is sometimes assigned by astronomers to the "giant ice planet" due to its chemical composition similar to Neptune but different from the two giant gas planets, Jupiter and Saturn.

Uranus has a very strange magnetic field. The magnetic field axis is inclined at an angle of 60° to the rotation axis, not through the center of mass like other planets in our solar system.
