

# The world's largest aircraft reaches an altitude of nearly 1,200 m

Airlander 10, the world's largest aircraft with a weight of up to 20 tons, has a 92m-length display that impresses when it reaches a height of nearly 1,200 m during the last test flight on 13 June.

Airlander 10, the world's largest aircraft with a weight of up to 20 tons, has a 92m-length display that impresses when it reaches a height of nearly 1,200 m during the last test flight on 13 June.

1. Meaning of numbers on airport runways
2. what the aircraft black box?

Airlander 10 on test flight on June 13.

Airlander 10 is a combination of aircraft, helicopters and air balloons with the nickname "Flying Bum". With a volume of 38,000 m<sup>3</sup>, this giant aircraft can carry 10 tons of cargo and 60 passengers.

This is the 4th test flight and also the highest flight of this flight. During the previous flight test on August 24, 2016, it was badly damaged when it hit the ground.

It is hoped that Airlander 10 will be used for luxury commercial flights to the best places in the world in 2019.
