

Things to know about backing up your iPhone and iPad

With the instructions in this article, you will know how to control iCloud capacity and choose how to backup it to best suit

Automatically backing up your data and information on your iPhone, iPad and iPod Touch will help you manage the data on your device better. When your device is backed up data on your iCloud account, when you lose data or switch to a new device, you can restore what you have lost and transfer the data to a new device easily.

By default, each iCloud account will only provide 5GB of free storage, if you can buy more data, the management will be more relieved. Otherwise, you will have to manage your data to keep what matters most. Here's what you need to do for your iCloud account.

1. How to log out of an Apple ID account on iPhone
2. How to protect your iCloud account from being stolen
3. How to access iCloud on Android

Manage iCloud storage and how to change storage plan

When you set up your iCloud during device setup, it will automatically back up with iCloud online storage service. The backup process will happen when your device is connected to Wifi, you will see the backup time at any time. So you will know which data is not available in the automatic backup of iCloud.

To check if iCloud is automatically backed up, follow the steps below.

Step 1: Go to the Settings menu, select your iCloud account at the top, then click iCloud below

Backup with iTunes

You can create an iTunes backup using the connection cable between Apple devices and the computer. Next unlock your device password (if available) and select **Trusted** . On the computer you turn on iTunes and select your device in the toolbar on the upper left corner, then select the **Summary** item.

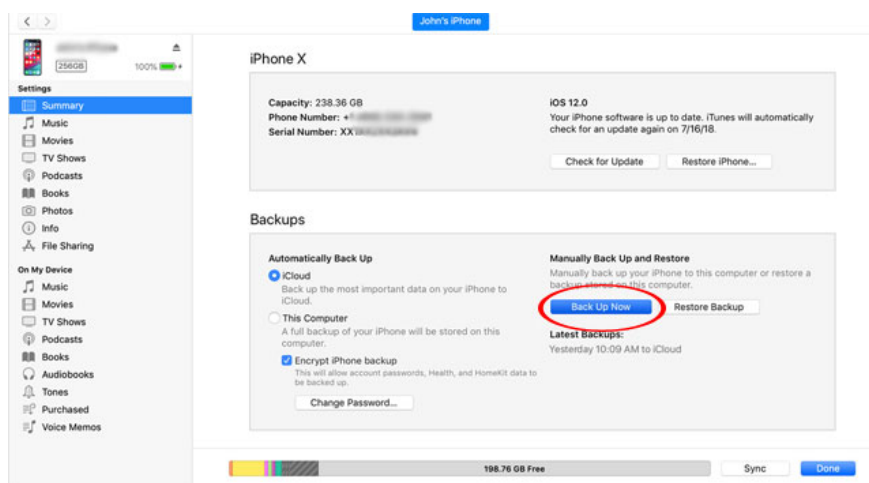

Next you will see your device information in the right window, including phone number, phone number, iOS version in use .

If you want to make a one-time backup on your computer, check This Computer to save the backup to your computer and click **Back Up Now** in the table below.

Note , backing up iTunes is different from backing up iCloud, when backing up via iTunes on your computer, you will receive the most complete copy of all data on the device. Later when you want to restore, this iTunes backup will bring your device to that state.

As for iCloud, only the most important data on the device will be backed up with your iCloud account. For example, backups on iClouds do not include music and videos, but backups on iTunes do.

This allows you to save iCloud storage space and limit the need to upload or download large data.

Most users with Apple devices in general and iPhone / iPad in particular, just backing up iCloud is enough, so backing up with iTunes is not necessary. However, before upgrading the machine, jailbreak or have any impact on your device, please backup it with iTunes, then want to restore this backup you just need to click Restore Backup in the Summary section is .
