

This is why the dashboard usually displays a maximum speed above the threshold that the car can run

We all understand that the maximum speed of the vehicle we are driving cannot reach the speed shown on the clock, except for the million-dollar cars with the horrible performance like the Bugatti Chiron. So, why do manufacturers let these watches not reflect the same performance?

We all understand that the maximum speed of the vehicle we are driving cannot reach the speed shown on the clock, except for the million-dollar cars with the horrible performance like the Bugatti Chiron. So, why do manufacturers let these watches not reflect the same performance? Let's find out!

1. Mass-produced components are used for many models

Money, eternal and most important reasons. The design for each individual model is almost 'impossible' because as a result production costs will increase significantly. In order to synchronize global production and optimize product prices, the dashboard in the higher-end models will share the average performance. For example, the Hyundai trio in Vietnam, including Elantra, Tucson and SantaFe, has a maximum display speed of 240 km / h.

Clock displayed in Hyundai Elantra.

2. Attract customers

The soaring numbers displayed on the dashboard are things that attract a group of customers who love speed. For customers, the larger the number line, the more powerful the motor vehicle is. And the fact that the dashboard has a higher maximum speed is actually one of the tips to help the manufacturer's car sales performance soar.

In the past, people had issued regulations to limit the display clock being inflated but were no longer maintained.

3. Psychological benefits to the driver

According to experts, the display clock is higher than the fact that more or less helps the driver control safer because we often lose control when entering the highway and tend to force the vehicle to operate. Highest continuous performance, causing unsafe. Besides the benefits, this also makes many people misunderstand and think that they are capable of handling difficult situations at high speeds, thereby becoming more subjective, reckless and even 'impulsive'.

4. Provisions in case of upgraded vehicles performance

Currently, many people after buying a car will upgrade the engine performance of the car. Therefore, the manufacturer has "left out" an extra space to fully display the added speed of the cars.
