

This startup's AI creates custom software in just a few minutes, at a low cost

Proofs, a startup based in San Francisco (USA) and Warsaw (Poland) has developed technology using AI agents that can develop software in just a few minutes instead of a whole year with the traditional method, promising creating a breakthrough in the field of software technology.

This startup has developed technology that uses AI agents to automate the software development process with the aim of creating on-demand software to help businesses reduce time and costs.

API-first companies often have to spend between \$10,000 and \$1 million to get custom software for process-built projects that can take up to a year.

Proofs asserts that using AI agents can reduce custom software development time to just a few minutes and significantly reduce costs compared to traditional processes.

Proofs has successfully raised \$2.6 million in pre-seed funding from EarlyBird Digital East, along with Expeditions Fund, Step Function Ventures, RTP Global and a number of angel investors. This startup said it will use this money to build a team of experienced engineers to develop products and expand the market.

Proofs is entering a potentially competitive market with 'heavyweight' competitors. But CEO Pucek is confident that they have a competitive advantage in proprietary technology that helps perform complex tasks at low cost.
